5 Abstract

6 This contribution proposes a concept paper for paging. It uses the following three-part template adopted in  
7 GAHW-010241[12]: identify requirements, recommend concept, and identify impact on specifications.

8 The requirements section uses the model proposed by Alan Cooper in *The Inmates are Running the Asylum – Why*  
9 *High-Tech Products Drive Us Crazy and How to Restore the Sanity*.

10 Questions and comments appear in magenta within angled brackets, e.g., <comment>.

11 Proposals appear in blue, e.g., [proposal](#).

12 This contribution is available in *Acrobat* and *Word* formats. The *Acrobat* format is smaller and has fewer display  
13 artifacts.

# 1. Requirements

This document presents paging-related requirements. Based on these requirements, it develops concepts, and from the concepts, assesses the impact on new and existing standards. To focus requirements, it proposes persona, as suggested by Alan Cooper in *The Inmates are Running the Asylum* [1].

## 1.1 Persona

Lloyd sells specialty automotive parts for Merit, a multinational supplier. His customers include autobody shops, garages, trucking companies, fleet operators, and auto-parts retailers.

Lloyd's key objective is customer service: customers should be able to phone him at any time and get through to Lloyd or his voice mail. From 08:00 to 19:00, seven days a week, Lloyd returns calls within 2 hours.

Lloyd uses two wireless devices:

- A small handset exclusively used for voice.  
The handset is on 24 hours a day, 7 days a week. It is Lloyd's key communication device. This handset complies with release-99 specifications for voice terminals. It does not support GPRS.
- A laptop computer for checking stock and processing orders.  
This laptop contains a GPRS PC card that allows wireless data access to Merit's servers. The computer is only on when Lloyd is entering new orders or checking status of outstanding orders. Lloyd seldom uses e-mail: he prefers to talk to his customers by phone or meet with them in person.

In the future, Lloyd may want a single device that allows him to perform everything he does now. This document assumes the future is now.

## 1.2 User-based requirements

To increase battery life, paging shall support discontinuous reception.

Incoming voice calls shall be processed whether or not a data session is active.

Incoming data transfers shall be processed whether or not a voice call is active.

## 1.3 System-based requirements

This section incorporates agreements documented in GP-010975 [14].

<Each requirement in this section should indicate why the requirement exists.>

Any mobile station that supports *Iu mode* shall camp on a PCCCH if present. <Why?>

If a PCCCH is present, the mobile station shall monitor it in *RRC Idle* and *RRC Connected* modes. <Why should the mobile station always monitor PCCCH in *RRC Connected* mode? If GERAN supports coordinated paging, which it should, a mobile station with an active TBF should only have to monitor PACCH.>

So the core network and GERAN can establish a signalling link with a mobile station, two types of paging shall be supported: GERAN-initiated and CN-initiated. The mobile station shall be able to determine which network (GERAN or CN) initiated the page.

A single PACKET PAGING REQUEST shall be able to contain pages for *A/Gb-mode* and *Iu-mode* mobile stations. <Seems needlessly restrictive.>

A mobile station may respond to a page via a dedicated control channel or via a TBF. <If a mobile station responds to a circuit page using a TBF, it may lose the incoming call if it reselects to a new cell.>

*Iu-mode* paging shall comply with the concepts in this document.

1 *A/Gb-mode* paging shall comply with the concepts in 43.064 [7].

## 2 1.4 User-based scenarios

3 The following scenarios will be used to develop the paging concepts in § 2:

- 4 • Lloyd receives a voice call.
- 5 • Lloyd receives a voice call while checking the status of a customer's order.
- 6 • Lloyd receives an e-mail order confirmation.
- 7 • Lloyd receives an e-mail order confirmation while engaged in a voice call.

## 8 1.5 System-based scenarios

9 GERAN shall initiate a page for the following purposes:

- 10 • Locate a mobile station to its serving cell.
- 11 • Activate radio bearers.

12 The CN shall initiate a page for the following purposes:

- 13 • Locate a mobile station to its serving BSS.
- 14 • Activate radio access bearers.

---

## 2. Concept

Sequences in this section derive from the requirements and scenarios of § 1. Figures contain the sequence diagrams. A table following each figure describes message events in the sequence, including the values of directly relevant information elements.

<Until 44.018 stabilizes, information elements specified in the tables may be a strange mix of UTRAN and GERAN.>

Within each sequence diagram, the following conventions apply:

- Green arrows indicate unciphered messages.
- Red arrows indicate ciphered messages.

<Ciphered messages need to be confirmed when the concept paper on ciphering and integrity protection is ready.>

- Heavy vertical lines indicate a stimulus-response relationship between messages.

Unless stated otherwise, the following conditions apply for each sequence:

- The CN and GERAN operate in *GERAN Network Operation Mode II*: SGSN and MSC are not connected via a *Gs* interface; circuit pages arrive over the *Iu-cs* interface. See § A for a description of network-operation modes for GPRS, UMTS, and GERAN.

<Mode I may be a better choice. In fact, maybe it should be the only choice.>

- The CCCH supports discontinuous reception according to the formulas described in § B.1.
- The PCCCH supports discontinuous reception according to the formulas described in § B.2.
- MM, PMM, and RRC have the states described in § C.

### 2.1 Incoming voice call – assign dedicated channel

In this section, the GERAN RRC assigns an SDCCH (Stand-Alone Dedicated Control Channel) for the mobile station to respond to the page.

#### 2.1.1 Incoming voice call – *RRC-Idle*

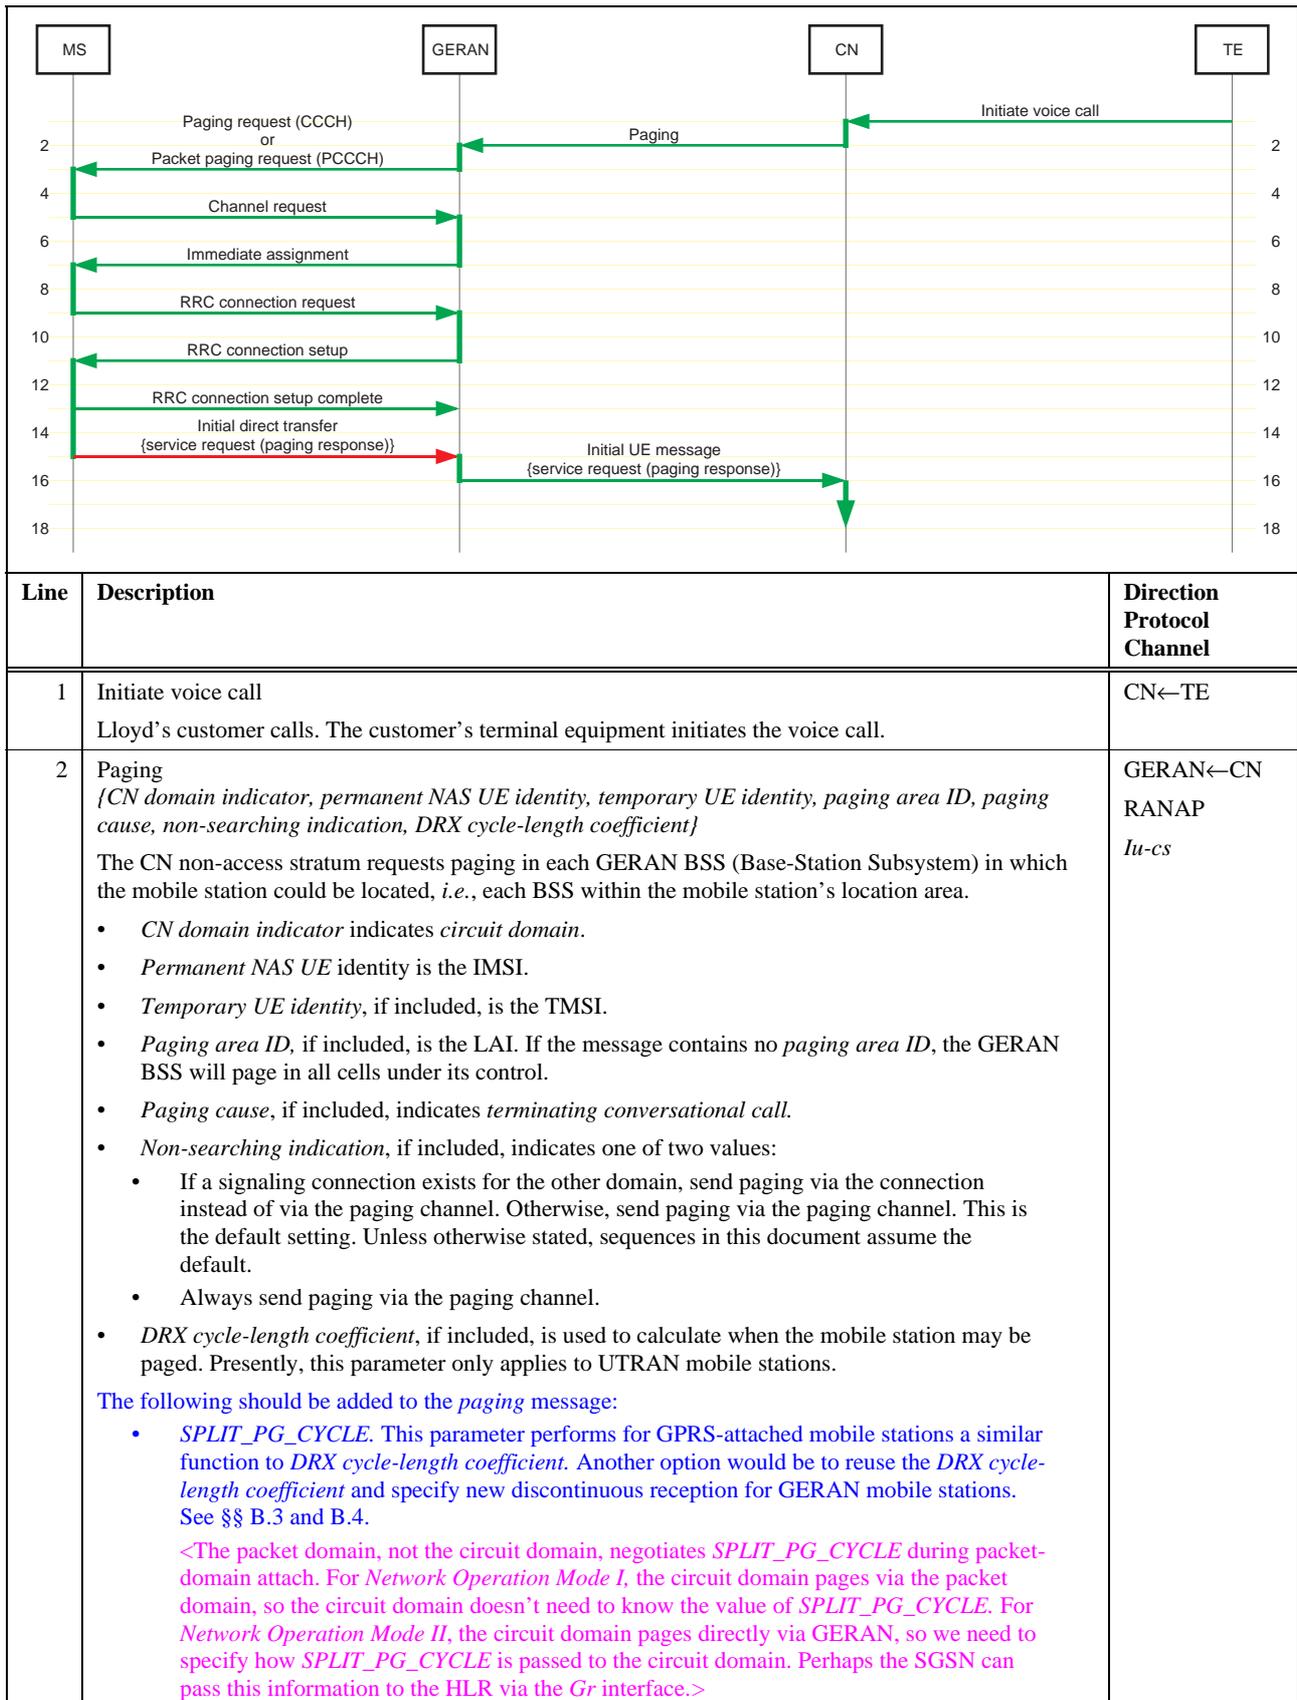

This sequence corresponds to the following user-based scenario:

- Lloyd receives a voice call.

Figure 1 shows the paging-related portion of an incoming voice call under the following conditions:

- RRC is in *RRC-Idle* mode.
- MM is in *MM-Idle* state.
- PMM is in *PMM-Idle* state.
- Mobile station camps on a CCCH or a PCCCH.

Figure 1: Incoming voice call – RRC-Idle, assign dedicated channel

3a	<p>Paging request <i>{page mode, channel needed, mobile identity, P1 rest octets}</i></p> <p>Since the GERAN RRC is in <i>RCC-Idle</i> mode for this IMSI, it does not know where the mobile station is. It therefore sends a <i>paging request</i> on all paging channels the mobile station could monitor. Upon receipt of the <i>paging request</i>, the MS RRC informs its non-access stratum that the core network has paged it. The MS NAS responds to the page.</p> <ul style="list-style-type: none"> <li>• <i>Channel needed</i> indicates SDCCH.</li> <li>• <i>Mobile identity</i> is the mobile station's IMSI, or if available, TMSI.</li> <li>• <i>P1 rest octets</i> indicates <i>paging procedure for RR connection establishment</i>. RRC only includes this information if <i>mobile identity</i> is IMSI. If mobile identity is TMSI, <i>paging procedure for RR connection establishment</i> is assumed.</li> </ul> <p>The following should be added to the <i>paging request</i>:</p> <ul style="list-style-type: none"> <li>• An indication of which network element initiated the page: CN or GERAN.</li> <li>• An indication of which core network initiated the page: circuit-domain or packet-domain. If paging with IMSI, this element must be included. If paging with P-TMSI or TMSI, the element could be omitted since the identity could implicitly indicate the network initiating the page. If this information element is always included, the mobile station could be paged in one domain (e.g., circuit) using an available temporary identity from the other domain (e.g., P-TMSI).</li> <li>• <i>Paging cause</i> from the RANAP paging message.</li> </ul>	MS←GERAN RRC CCCH (PCH)
3b	<p>Packet paging request <i>{page mode, persistence level, NLN, page info (TBF or dedicated, mobile identity, channel needed)}</i></p> <p>Since the GERAN RRC is in <i>Idle</i> mode for this IMSI, it does not know where the mobile station is. It therefore has MAC send a <i>packet paging request</i> on all paging channels the mobile station could monitor. Upon receipt of the <i>packet paging request</i>, the MS MAC informs its non-access stratum that the core network has paged it. The MS NAS responds to the page.</p> <ul style="list-style-type: none"> <li>• <i>TBF or dedicated</i> indicates establishment of a dedicated connection.</li> <li>• <i>Mobile identity</i> is the mobile station's IMSI, or if available, TMSI.</li> <li>• <i>Channel needed</i> indicates SDCCH.</li> </ul> <p>The following should be added to the <i>packet paging request</i>:</p> <ul style="list-style-type: none"> <li>• An indication of which network element initiated the page: CN or GERAN.</li> <li>• An indication of which core network initiated the page: circuit-domain or packet-domain. If paging with IMSI, this element must be included. If paging with P-TMSI or TMSI, the element could be omitted since the identity could implicitly indicate the network initiating the page. If this information element is always included, the mobile station could be paged in one domain (e.g., circuit) using an available temporary identity from the other domain (e.g., P-TMSI).</li> <li>• <i>Paging cause</i> from the RANAP paging message.</li> </ul>	MS←GERAN MAC PCCCH (PPCH)
5	<p>Channel request <i>{establishment cause, random reference}</i></p> <p>The MS RRC requests a channel to respond to the page.</p> <ul style="list-style-type: none"> <li>• <i>Establishment cause</i> indicates <i>answer to paging</i>.</li> </ul>	MS→GERAN RRC CCCH (RACH)
7	<p>Immediate assignment <i>{page mode, dedicated mode or TBF, channel description, request reference, timing advance, mobile allocation, starting time, IA rest octets (frequency parameters before time)}</i></p> <p>The GERAN RRC assigns an SDCCH.</p> <ul style="list-style-type: none"> <li>• <i>Dedicated mode or TBF</i> indicates <i>dedicated mode</i>.</li> <li>• <i>Request reference</i> contains the contents of the <i>channel request</i> message and the frame number in which the <i>channel request</i> message was received.</li> <li>• <i>Channel description</i> specifies parameters for the SDCCH.</li> </ul>	MS←GERAN RRC CCCH (AGCH)

9	<p>RRC connection request <i>{initial UE identity, establishment cause}</i></p> <p>Since the MS RRC is in <i>RCC-Idle</i> mode, it needs to establish an RRC connection with its GERAN peer. It therefore sends an <i>RRC connection request</i>.</p> <ul style="list-style-type: none"> <li>• <i>Initial UE identity</i> indicates IMSI, or if available, TMSI.</li> <li>• <i>Establishment cause</i> indicates <i>terminating conversational call</i>.</li> </ul> <p>&lt;Do we want to define an RB0 to carry the <i>RRC connection request</i> and <i>RRC connection setup</i>? Such a radio bearer would have an RLC instance, e.g., <i>acknowledged mode</i>.&gt;</p>	MS→GERAN RRC SDCCH
11	<p>RRC connection setup <i>{initial UE identity, RRC transaction identifier, new U-RNTI, RRC state indicator, UTRAN DRX cycle-length coefficient, signalling RB information setup list}</i></p> <p>The GERAN RRC provides the information needed to support the RRC connection.</p> <ul style="list-style-type: none"> <li>• <i>Initial UE identity</i> indicates IMSI, or if available, TMSI.</li> <li>• <i>RRC transaction identifier</i> identifies the transaction. Subsequent messages in the transaction use this identifier.</li> <li>• <i>New U-RNTI</i> (in GERAN, G-RNTI) provides the new GERAN <i>Radio Network Temporary Identifier</i>. The identifier applies for the duration of the RRC connection.</li> <li>• <i>RRC state indicator</i> specifies that the mobile station enter <i>RRC Cell Dedicated</i> state.</li> <li>• <i>UTRAN DRX cycle-length coefficient</i> is used to calculate when the mobile station may be paged while connected to this UTRAN. &lt;For GERAN, <i>GERAN_SPLIT_PG_CYCLE</i> should be used.&gt;</li> <li>• <i>Signalling RB information setup list</i> configures the four signaling radio bearers.</li> </ul> <p>The following should be included in the <i>RRC connection setup</i> message:</p> <ul style="list-style-type: none"> <li>• <i>GERAN_SPLIT_PG_CYCLE</i>. This parameter performs for GPRS-attached mobile stations a similar function to the <i>UTRAN DRX cycle-length coefficient</i>. See § B.4.</li> </ul>	MS←GERAN RRC SDCCH
13	<p>RRC connection setup complete <i>{RRC transaction identifier, START list, UE radio access capability}</i></p> <p>The MS RRC confirms setup of the RRC connection. RRC enters <i>RRC-Cell_Dedicated</i> state. The following radio bearers now exist: RB1 (unacknowledged access-stratum signalling), RB2 (acknowledged access-stratum signalling), RB3 (acknowledged high-priority non-access-stratum signalling), and RB4 (acknowledged low-priority non-access-stratum signalling).</p> <ul style="list-style-type: none"> <li>• <i>RRC transaction identifier</i> is the value sent in the <i>RRC connection setup</i> message.</li> <li>• <i>START list</i> identifies the CN domain (circuit) and initializes the 20 most-significant bits of the hyperframe numbers. &lt;Is this initialization the first point where ciphering and integrity protection can operate?&gt;</li> <li>• <i>UE radio-access capability</i> indicates the mobile station's capabilities with respect to the <i>Um</i> interface, e.g., PDCP capability, RLC capability, RF capability.</li> </ul>	MS→GERAN RRC RB2 (SDCCH)
15	<p>Initial direct transfer <i>{CN domain identity, intra-domain NAS node selector, NAS message}</i></p> <p>The MS RRC initiates a signaling connection to the circuit CN and forwards the MS NAS paging response.</p> <ul style="list-style-type: none"> <li>• <i>CN domain identity</i> indicates <i>circuit domain</i>.</li> <li>• <i>Intra-domain NAS node selector</i> indicates the NAS node to which the MS wants to establish a connection.</li> <li>• <i>NAS message</i> contains the <i>service request</i> message indicating <i>paging response</i>.</li> </ul>	MS→GERAN RRC RB3 (SDCCH)
16	<p>Initial UE message <i>{CN domain indicator, LAI, SAI, NAS-PDU, Iu signalling-connection identifier, Global RNC-ID}</i></p> <p>GERAN forwards the page response to the CN.</p> <ul style="list-style-type: none"> <li>• <i>CN domain indicator</i> indicates <i>circuit domain</i>.</li> <li>• <i>LAI</i> indicates the location area in which the RRC connection exists.</li> <li>• <i>SAI</i> indicates the service area where the mobile station is consuming resources.</li> <li>• <i>Iu signalling-connection identifier</i> is assigned by GERAN and stored by the CN for the duration of the <i>Iu</i> connection.</li> <li>• <i>Global RNC-ID</i> uniquely identifies this GERAN.</li> </ul>	GERAN→CN RANAP <i>Iu-cs</i>

## 1 2.1.2 Incoming voice call – *RRC-Cell\_Shared*

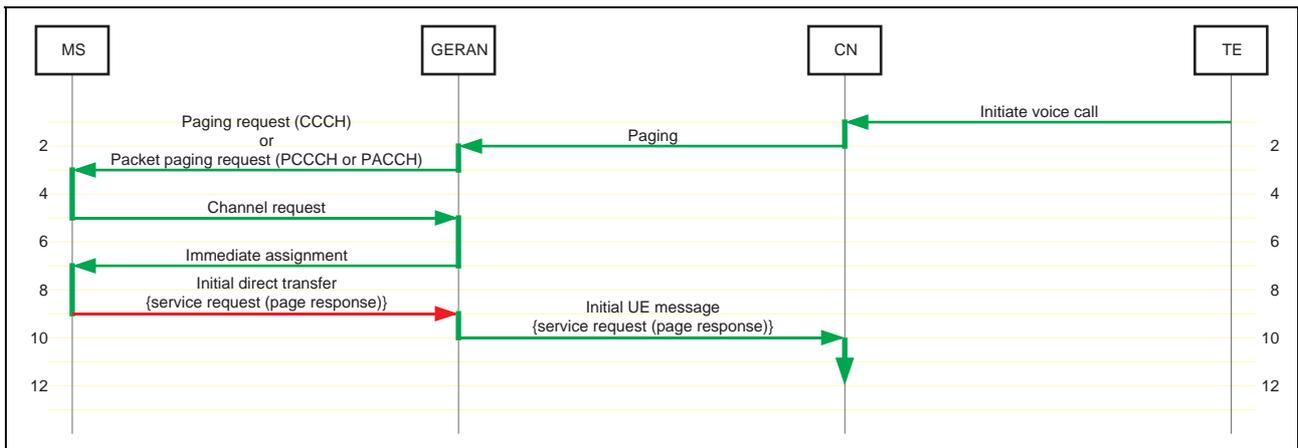

2 This sequence corresponds to the following user-based scenario:

- 3 • Lloyd receives a voice call while checking the status of a customer's order.

4 Figure 2 shows the paging-related portion of an incoming voice call under the following conditions:

- 5 • RRC is in *RRC-Cell\_Shared* state.
- 6 • MM is in *MM-Idle* state.
- 7 • PMM is in *PMM-Connected* state.
- 8 • Mobile station camps on a CCCH or a PCCCH (*i.e.*, it does not have an active TBF, or it has an active TBF and  
9 GERAN is not capable of coordinated paging), or it monitors a PACCH (*i.e.*, it has an active TBF and GERAN  
10 is capable of coordinated paging).

Figure 2: Incoming voice call – *RRC-Cell\_Shared*, assign dedicated channel

Line	Description	Direction Protocol Channel
1	Initiate voice call Lloyd's customer calls while Lloyd is checking the status of a customer order. The customer's terminal equipment initiates the voice call.	CN←TE
2	Paging {CN domain indicator, permanent NAS UE identity, temporary UE identity, paging area ID, paging cause, non-searching indication, DRX cycle-length coefficient} Same as § 2.1.1 line 2 with the following exceptions: <ul style="list-style-type: none"> <li>Paging area ID, if included, can be ignored. GERAN knows the mobile station's location.</li> </ul>	GERAN←CN RANAP Iu-cs
3a	Paging request {page mode, channel needed, mobile identity, P1 rest octets} Since the GERAN RRC is in <i>RRC-Cell_Shared</i> state for this IMSI, it knows where the mobile station is. It therefore sends a <i>paging request</i> on the paging channel the mobile station is monitoring. Upon receipt of the <i>paging request</i> , the MS RRC informs its non-access stratum that the core network has paged it. The MS NAS responds to the page. <ul style="list-style-type: none"> <li>Channel needed indicates SDCCH.</li> <li>Mobile identity is the G-RNTI.</li> <li>P1 rest octets indicates <i>paging procedure for RR connection establishment</i>. &lt;Presently, RRC only includes this information if mobile identity is IMSI.&gt;</li> </ul> The following should be added to the <i>paging request</i> : <ul style="list-style-type: none"> <li>G-RNTI as a <i>mobile identity</i>.</li> <li>An indication of which network element initiated the page: CN or GERAN.</li> <li>An indication of which core network initiated the page: circuit-domain or packet-domain.</li> <li>Paging cause from the RANAP <i>paging</i> message.</li> <li>P1 rest octets applies when paging with G-RNTI. This applies for <i>paging request type 1</i>. P2 rest octets should also be updated for <i>paging request type 2</i>.</li> </ul>	MS←GERAN RRC CCCH (PCH)

3b	<p>Packet paging request  <i>{page mode, persistence level, NLN, page info (TBF or dedicated, mobile identity, channel needed)}</i></p> <p>Since the GERAN RRC is in <i>RRC-Cell_Shared</i> state for this IMSI, it knows where the mobile station is. It therefore has MAC send a <i>packet paging request</i> on the channel the mobile station is monitoring. Upon receipt of the <i>packet paging request</i>, the MS MAC informs its non-access stratum that the core network has paged it. The MS NAS responds to the page.</p> <ul style="list-style-type: none"> <li>• <i>TBF or dedicated</i> indicates establishment of a dedicated connection.</li> <li>• <i>Mobile identity</i> is the G-RNTI.</li> <li>• <i>Channel needed</i> indicates SDCCH.</li> </ul> <p>The following should be added to the <i>packet paging request</i>:</p> <ul style="list-style-type: none"> <li>• G-RNTI as a <i>mobile identity</i>.</li> <li>• An indication of which network element initiated the page: CN or GERAN.</li> <li>• An indication of which core network initiated the page: circuit-domain or packet-domain.</li> <li>• <i>Paging cause</i> from the RANAP <i>paging message</i></li> </ul>	<p>MS←GERAN  MAC  PCCCH (PPCH) or  PACCH</p>
5	<p>Channel request  <i>{establishment cause, random reference}</i></p> <p>Same as § 2.1.1 line 5.</p>	<p>MS→GERAN  RRC  CCCH (RACH)</p>
7	<p>Immediate assignment  <i>{page mode, dedicated mode or TBF, channel description, request reference, timing advance, mobile allocation, starting time, IA rest octets (frequency parameters before time)}</i></p> <p>Same as § 2.1.1 line 7 except for the following:</p> <ul style="list-style-type: none"> <li>• RRC enters <i>RRC-Cell_Dedicated</i> state.</li> </ul>	<p>MS←GERAN  RRC  CCCH (AGCH)</p>
	<p>&lt;At this point, 25.331 § 8.1.2.3 specifies that the mobile station perform a cell update. Since GERAN knows exactly where the mobile station is and the signaling radio bearers are established, why do we need a cell update? One reason would be to explicitly signal the RRC to enter <i>RRC-Cell_Dedicated</i> state.&gt;</p>	
9	<p>Initial direct transfer  <i>{CN domain identity, intra-domain NAS node selector, NAS message}</i></p> <p>Same as § 2.1.1 line 15.</p>	<p>MS→GERAN  RRC  RB3 (SDCCH)</p>
10	<p>Initial UE message  <i>{CN domain indicator, LAI, SAI, NAS-PDU, Iu signalling-connection identifier, Global RNC-ID}</i></p> <p>Same as § 2.1.1 line 16.</p>	<p>GERAN→CN  RANAP  Iu-cs</p>

1

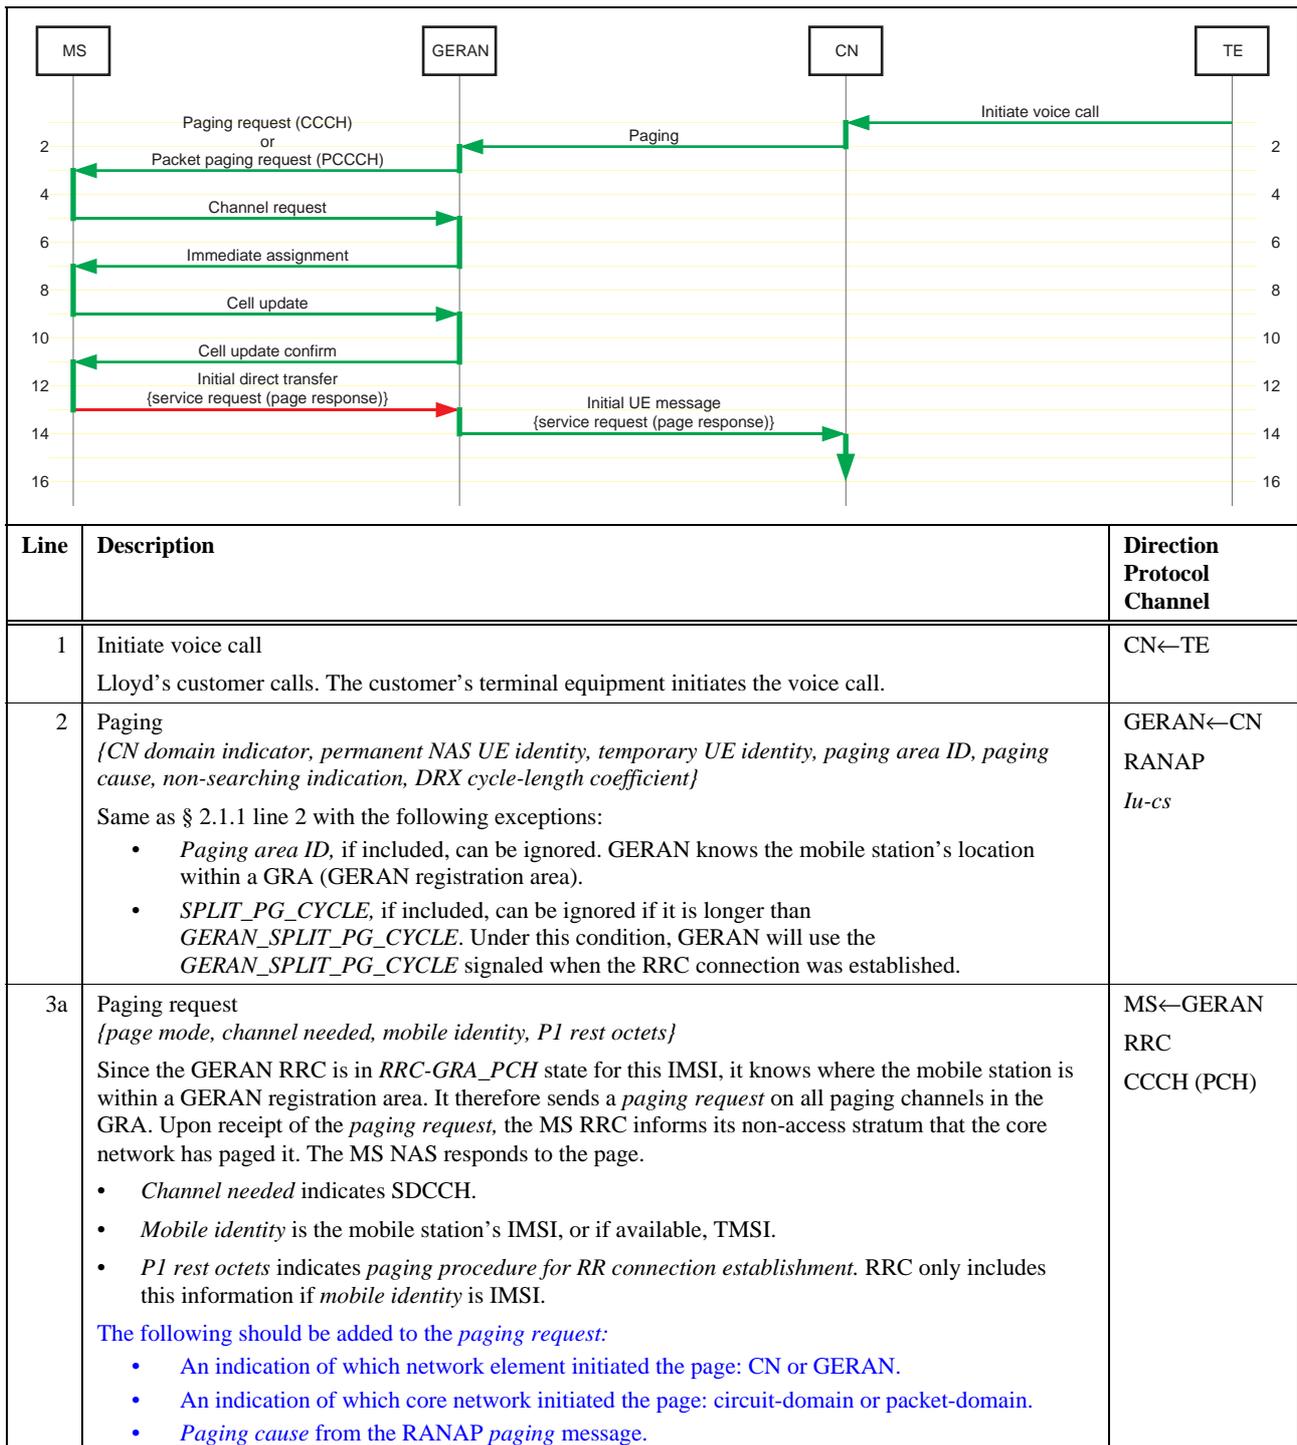

### 2 2.1.3 Incoming voice call – *RRC-GRA\_PCH*

3 This sequence corresponds to the following user-based scenario:

- 4
- Lloyd receives a voice call.

5 Figure 3 shows the paging-related portion of an incoming voice call under the following conditions:

- 6
- RRC is in *RRC-GRA\_PCH* state.
  - 7
  - MM is in *MM-Idle* state.
  - 8
  - PMM is in *PMM-Connected* state.
  - 9
  - Mobile station monitors a CCCH or a PCCCH.

Figure 3: Incoming voice call – RRC-*GRA\_PCH*, assign dedicated channel

3b	<p>Packet paging request {<i>page mode, persistence level, NLN, page info (TBF or dedicated, mobile identity, channel needed)</i>}</p> <p>Since the GERAN RRC is in <i>RRC-GRA_PCH</i> state for this IMSI, it knows where the mobile station is within a GRA. It therefore has MAC send a <i>packet paging request</i> on all paging channels in the GRA. Upon receipt of the <i>packet paging request</i>, the MS MAC informs its non-access stratum that the core network has paged it. The MS NAS responds to the page.</p> <ul style="list-style-type: none"> <li>• <i>TBF or dedicated</i> indicates establishment of a dedicated connection.</li> <li>• <i>Mobile identity</i> is the mobile station's IMSI, or if available, TMSI.</li> <li>• <i>Channel needed</i> indicates SDCCH.</li> </ul> <p>The following should be added to the <i>packet paging request</i>:</p> <ul style="list-style-type: none"> <li>• An indication of which network element initiated the page: CN or GERAN.</li> <li>• An indication of which core network initiated the page: circuit-domain or packet-domain.</li> <li>• <i>Paging cause</i> from the RANAP paging message.</li> </ul>	MS←GERAN MAC PCCCH (PPCH)
5	<p>Channel request {<i>establishment cause, random reference</i>}</p> <p>The MS RRC requests a channel to respond to the page.</p> <ul style="list-style-type: none"> <li>• <i>Establishment cause</i> indicates <i>answer to paging</i>.</li> </ul>	MS→GERAN RRC CCCH (RACH)
7	<p>Immediate assignment {<i>page mode, dedicated mode or TBF, channel description, request reference, timing advance, mobile allocation, starting time, IA rest octets (frequency parameters before time)</i>}</p> <p>The GERAN RRC assigns an SDCCH.</p> <ul style="list-style-type: none"> <li>• <i>Dedicated mode or TBF</i> indicates <i>dedicated mode</i>.</li> <li>• <i>Request reference</i> contains the contents of the <i>channel request</i> message and the frame number in which the <i>channel request</i> message was received.</li> <li>• <i>Channel description</i> specifies parameters for the SDCCH.</li> </ul>	MS←GERAN RRC CCCH (AGCH)
9	<p>Cell update {<i>U-RNTI, START list, AM_RLC error indication (RB2 or RB3), AM_RLC error indication (RB4 and upwards), cell-update cause, RB-timer indicator</i>}</p> <p>The MS RRC updates its cell-location information in the GERAN RRC by sending a <i>cell update</i>. The GERAN RRC now knows the mobile station's location to the cell level instead of the GRA level.</p> <ul style="list-style-type: none"> <li>• <i>U-RNTI</i> (in GERAN, G-RNTI) identifies the mobile station.</li> <li>• <i>START list</i> identifies the CN domain (circuit) and initializes the 20 most-significant bits of the hyperframe numbers.</li> <li>• <i>AM_RLC error indication (RB2 or RB3)</i> indicates <i>no error</i>.</li> <li>• <i>AM_RLC error indication (RB4 and upwards)</i> indicates <i>no error</i>.</li> <li>• <i>Cell-update cause</i> indicates <i>paging response</i>.</li> <li>• <i>RB-timer indicator</i> indicates if T314 or T315 have expired. These timers relate to radio-link failure.</li> </ul>	MS→GERAN RRC RB1 (SDCCH)

## 2.2 Incoming voice call – assign TBF

In this section, the GERAN RRC assigns a TBF (Temporary Block Flow) for the mobile station to respond to the page.

This sequences in this section are deprecated for the following reasons:

- If the mobile station reselects a new cell, the incoming voice call will be lost. <Network control of cell reselection may mitigate this problem.>

Since the sequences are deprecated, they may have been abandoned before they were completely specified. As such, this section may be incomplete and it may contain errors.

### 2.2.1 Incoming voice call – *RRC-Idle*, CCCH

This sequence corresponds to the following user-based scenario:

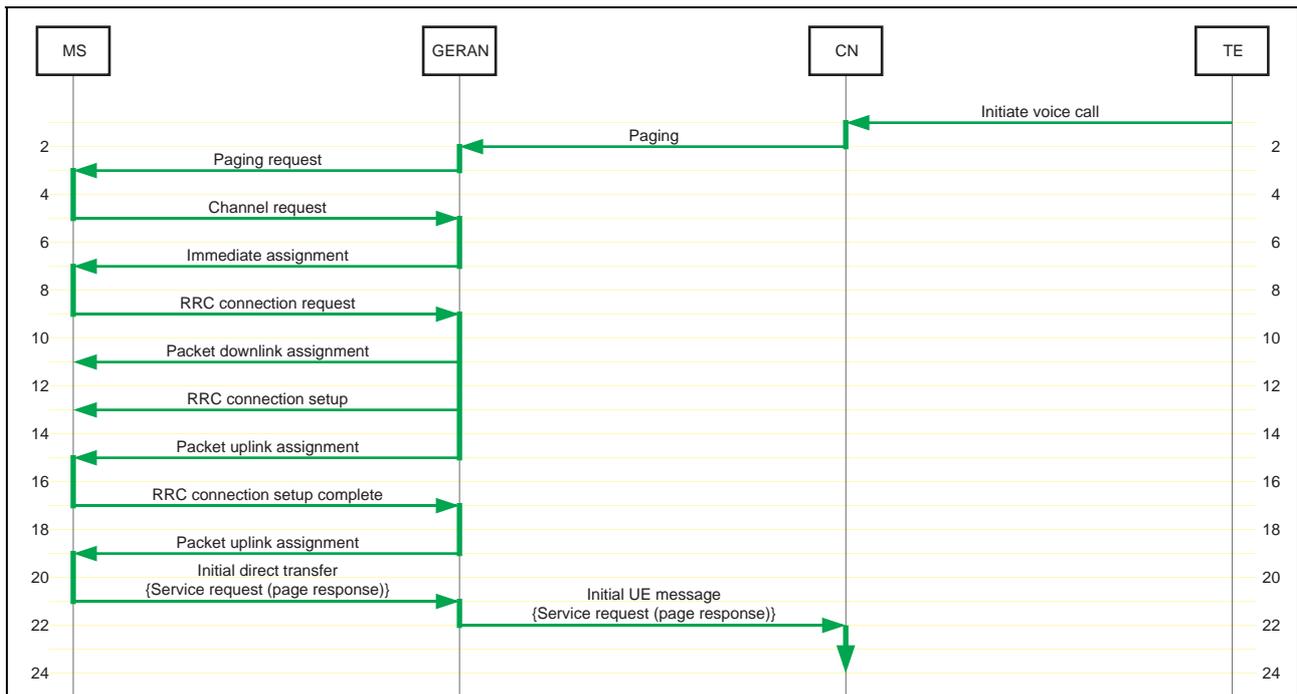

- Lloyd receives a voice call.

Figure 4 shows the paging-related portion of an incoming voice call under the following conditions:

- RRC is in *RRC-Idle* mode.
- Mobile camps on a CCCH.

14

Figure 4: Incoming voice call – RRC-Idle, CCCH, assign TBF

Line	Description	Direction Protocol Channel
1	Initiate voice call Lloyd's customer calls. The customer's terminal equipment initiates the voice call.	
2	Paging {CN domain indicator, permanent NAS UE identity, temporary UE identity, paging area ID, paging cause, non-searching indication, DRX cycle-length coefficient} Same as § 2.1.1 line 2.	RANAP <i>Iu-cs</i>
3	Paging request {page mode, channel needed, mobile identity, P1 rest octets} Since the GERAN RRC is in <i>Idle</i> state for this IMSI, it does not know where the mobile station is. It therefore sends a <i>paging request</i> on all paging channels the mobile station could monitor. Upon receipt of the <i>paging request</i> , the MS RRC informs its non-access stratum that the core network has paged it. The MS NAS responds to the page. <i>Channel needed</i> indicates any channel. The mobile station ignores this value. <i>Mobile identity</i> is the mobile station's IMSI, or if available, TMSI.	RRC CCCH (PCH)
5	Channel request {establishment cause, random reference} The MS RRC requests a channel to respond to the page. <i>Establishment cause</i> indicates <i>one-phase packet access</i> .	RRC CCCH (RACH)
7	Immediate assignment {page mode, dedicated mode or TBF, packet-channel description, request reference, timing advance, mobile allocation, starting time, IA rest octets (Packet uplink assignment)} The GERAN RRC assigns a PDCH. <i>Dedicated mode or TBF</i> indicates <i>TBF</i> . <i>Packet-channel description</i> specifies parameters for the PDCH. <i>Request reference</i> contains the contents of the <i>channel request</i> message and the frame number in which the <i>channel request</i> message was received. <i>IA rest octets</i> contains a <i>packet uplink assignment</i> .	RRC CCCH (AGCH)
9	RRC connection request {initial UE identity, establishment cause} Same as § 2.1.1 line 9.	RRC PDCH

11	<p>Packet downlink assignment  <i>{page mode, persistence level, global TFI, MAC mode, RLC mode, control ack, timeslot allocation, packet timing advance, P0, BTS pwr-control mode, PR mode, frequency parameters, downlink TFI assignment, power-control parameters, TBF starting time, measurement mapping}</i></p> <p>Under control of the GERAN RRC, the GERAN MAC allocates a downlink TBF so that the GERAN RRC can reply to the <i>RRC connection request</i>.</p> <p><i>Global TFI</i> is the uplink TFI assigned in line 7. It is used to address the mobile station. <i>MAC mode</i> indicates any of the four allocation modes. <i>RLC mode</i> indicates <i>acknowledged</i>. <i>Downlink TFI assignment</i> assigns a TFI for the downlink TBF.</p>	MAC PACCH
13	<p>RRC connection setup  <i>{initial UE identity, RRC transaction identifier, new G-RNTI, RRC state indicator, UTRAN DRX cycle-length coefficient, signalling RB information setup list}</i></p> <p>Same as § 2.1.1 line 11 except for the following:</p> <ul style="list-style-type: none"> <li>• <i>RRC state indicator</i> specifies that the mobile station enter <i>RRC Cell Shared</i> state.</li> </ul>	RRC PDTCH
15	<p>Packet uplink assignment  <i>{page mode, persistence level, global TFI, channel-coding command, TLLI-block channel coding, packet timing advance, frequency parameters, allocation (uplink TFI assignment)}</i></p> <p>Under control of the GERAN RRC, the GERAN MAC allocates an uplink TBF so the MS RRC can send an <i>RRC connection setup complete</i>.</p> <p><i>Global TFI</i> is the downlink TFI assigned in line 11. <i>Uplink TFI assignment</i> assigns a TFI for the uplink TBF.</p>	MAC PACCH
17	<p>RRC connection setup complete  <i>{RRC transaction identifier, START list, UE radio access capability}</i></p> <p>Same as § 2.1.1 line 13.</p>	RRC RB2 (PDTCH)
19	<p>Packet uplink assignment  <i>{page mode, persistence level, global TFI, channel-coding command, TLLI-block channel coding, packet timing advance, frequency parameters, allocation (uplink TFI assignment)}</i></p> <p>Under control of the GERAN RRC, the GERAN MAC allocates an uplink TBF so the MS RRC can send an <i>Initial direct transfer</i>.</p> <p><i>Global TFI</i> is the uplink TFI assigned in line 15.</p>	MAC PACCH
21	<p>Initial direct transfer  <i>{CN domain identity, intra-domain NAS node selector, NAS message}</i></p> <p>Same as § 2.1.1 line 15.</p>	RRC RB3 (PDTCH)
22	<p>Initial UE message  <i>{CN domain indicator, LAI, SAI, NAS-PDU, Iu signalling-connection identifier, Global RNC-ID}</i></p> <p>Same as § 2.1.1 line 16.</p>	RANAP <i>Iu-cs</i>

## 2 2.2.2 Incoming voice call – *RRC-Idle*, PCCCH

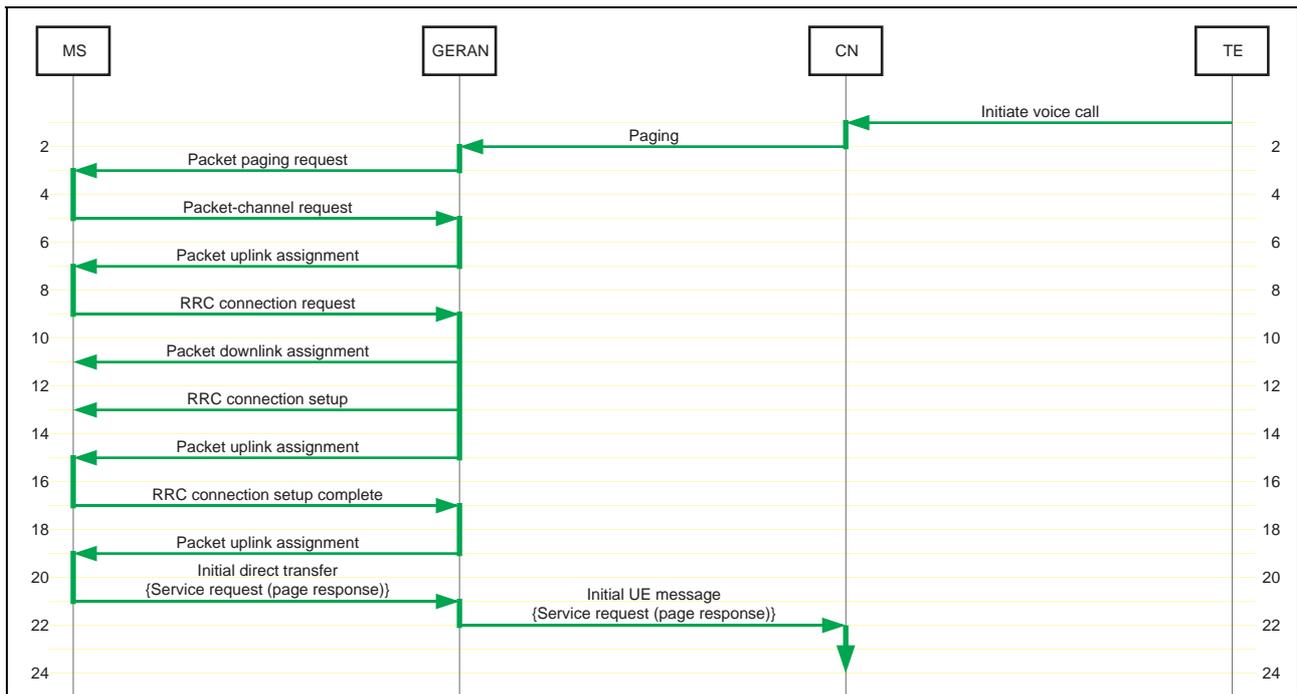

3 This sequence corresponds to the following user-based scenario:

- 4
- Lloyd receives a voice call.

5 Figure 5 shows the paging-related portion of an incoming voice call under the following conditions:

- 6
- RRC is in *RRC-Idle* mode.
- 7
- Mobile station camps on a PCCCH.

Figure 5: Incoming voice call – RRC-Idle, PCCCH, assign TBF

Line	Description	Direction	Protocol Channel
1	Initiate voice call Lloyd's customer calls. The customer's terminal equipment initiates the voice call.		
2	Paging {CN domain indicator, permanent NAS UE identity, temporary UE identity, paging area ID, paging cause, non-searching indication, DRX cycle-length coefficient} Same as § 2.1.1 line 2.	RANAP	Iu-CS
3	Packet paging request {page mode, persistence level, NLN, page info (TBF or dedicated, mobile identity)} Same as § x line 3 except the following: <ul style="list-style-type: none"> <li>TBF or dedicated indicates establishment of a TBF.</li> <li>Channel needed is not used.</li> </ul> <44.060 does not presently allow paging with TMSI for TBF establishment.>	RRC	PCCCH (PPCH)
5	Packet channel request {establishment cause, random bits} Under control of the MS RRC, the MS MAC requests a channel to respond to the page. Establishment cause indicates page response.	MAC	PCCCH (PRACH)
7	Packet uplink assignment {page mode, persistence level, packet-request reference, channel-coding command, TLLI-block channel coding, packet timing advance, frequency parameters, allocation (uplink TFI assignment)} Under control of the GERAN RRC, the GERAN MAC allocates an uplink TBF so the MS RRC can send an RRC connection request. Packet-request reference contains the establishment cause from the packet channel request and the frame number in which the GERAN MAC received the packet channel request. It is used to address the mobile station. Uplink TFI assignment assigns a TFI for the uplink TBF.	MAC	PCCCH (PAGCH)
9	RRC connection request {initial UE identity, establishment cause} Same as § 2.2.1 line 9.	RRC	PDTCH

11	Packet downlink assignment <i>{page mode, persistence level, global TFI, MAC mode, RLC mode, control ack, timeslot allocation, packet timing advance, P0, BTS pwr-control mode, PR mode, frequency parameters, downlink TFI assignment, power-control parameters, TBF starting time, measurement mapping}</i> Same as § 2.2.1 line 11.	MAC PACCH
13	RRC connection setup <i>{initial UE identity, RRC transaction identifier, new U-RNTI, RRC state indicator, UTRAN DRX cycle-length coefficient, signalling RB information setup list}</i> Same as § 2.2.1 line 13.	RRC PDTCH
15	Packet uplink assignment <i>{page mode, persistence level, global TFI, channel-coding command, TLLI-block channel coding, packet timing advance, frequency parameters, allocation (uplink TFI assignment)}</i> Same as § 2.2.1 line 15.	MAC PACCH
17	RRC connection setup complete <i>{RRC transaction identifier, START list, UE radio access capability}</i> Same as § 2.2.1 line 17.	RRC RB2 (PDTCH)
19	Packet uplink assignment <i>{page mode, persistence level, global TFI, channel-coding command, TLLI-block channel coding, packet timing advance, frequency parameters, allocation (uplink TFI assignment)}</i> Same as § 2.2.1 line 19.	MAC PACCH
21	Initial direct transfer <i>{CN domain identity, intra-domain NAS node selector, NAS message}</i> Same as § 2.2.1 line 21.	RRC RB3 (PDTCH)
22	Initial UE message <i>{CN domain indicator, LAI, SAI, NAS-PDU, Iu signalling-connection identifier, Global RNC-ID}</i> Same as § 2.2.1 line 22.	RANAP <i>Iu-cs</i>

1

### 2 2.2.3 Incoming voice call – RRC-Cell\_Shared

3 This sequence corresponds to the following user-based scenario:

- 4 • Lloyd receives a voice call while checking the status of a customer's order.

### 5 2.2.4 Incoming voice call – RRC-GRA\_PCH

6 This sequence corresponds to the following user-based scenario:

- 7 • Lloyd receives a voice call.

## 1 2.3 Incoming data transfer – assign dedicated channel

2 In this section, the GERAN RRC assigns a dedicated channel for the mobile station to respond to the page.

3 Sequences assume the following:

- 4 • The server initiates transfer of the e-mail; the client does not poll for e-mail.

### 5 2.3.1 Incoming data transfer – *RRC-Cell\_Dedicated*

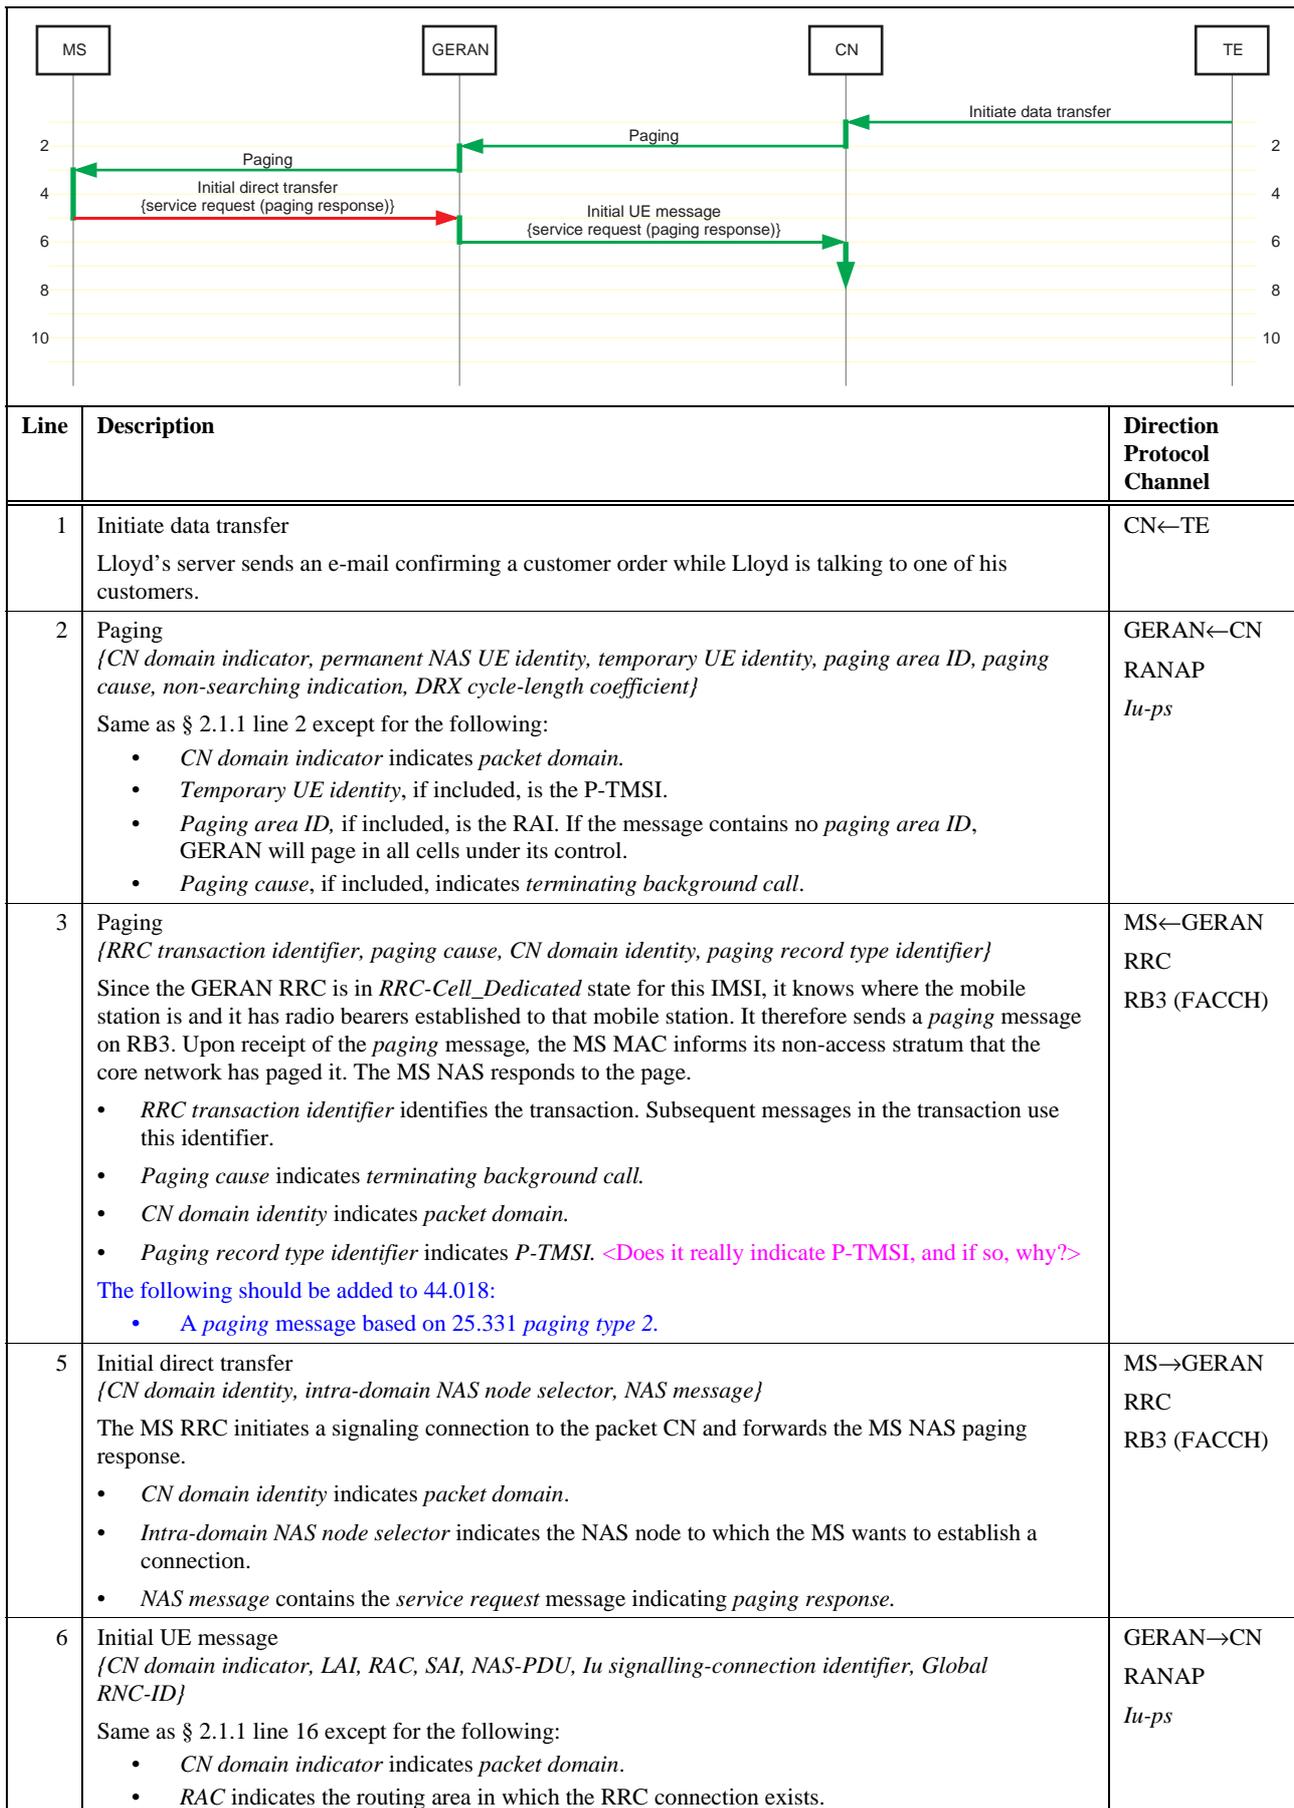

6 This sequence corresponds to the following user-based scenario:

- 7 • Lloyd receives an e-mail order confirmation while engaged in a voice call.

8 Figure 6 shows the paging-related portion of an incoming data transfer under the following conditions:

- 9 • RRC is in *RRC-Cell\_Dedicated* state.
- 10 • MM is in *MM-Connected* state.
- 11 • PMM is in *PMM-Idle* state.
- 12 • Mobile station is on a TCH.

Figure 6: Incoming data transfer – RRC-Cell\_Dedicated, assign dedicated

## 1 2.4 Incoming data transfer – assign TBF

2 In this section, the GERAN RRC assigns a TBF for the mobile station to respond to the page.

3 Sequences assume the following:

- 4 • The server initiates transfer of the e-mail; the client does not poll for e-mail.
- 5 • TBFs persist long enough for transactions to proceed without multiple channel requests and assignments.
- 6 • Multiple signalling radio bearers can share a TBF.
- 7 • The MS and GERAN use one-phase packet access.

### 8 2.4.1 Incoming data transfer – *RRC-Idle*, CCCH

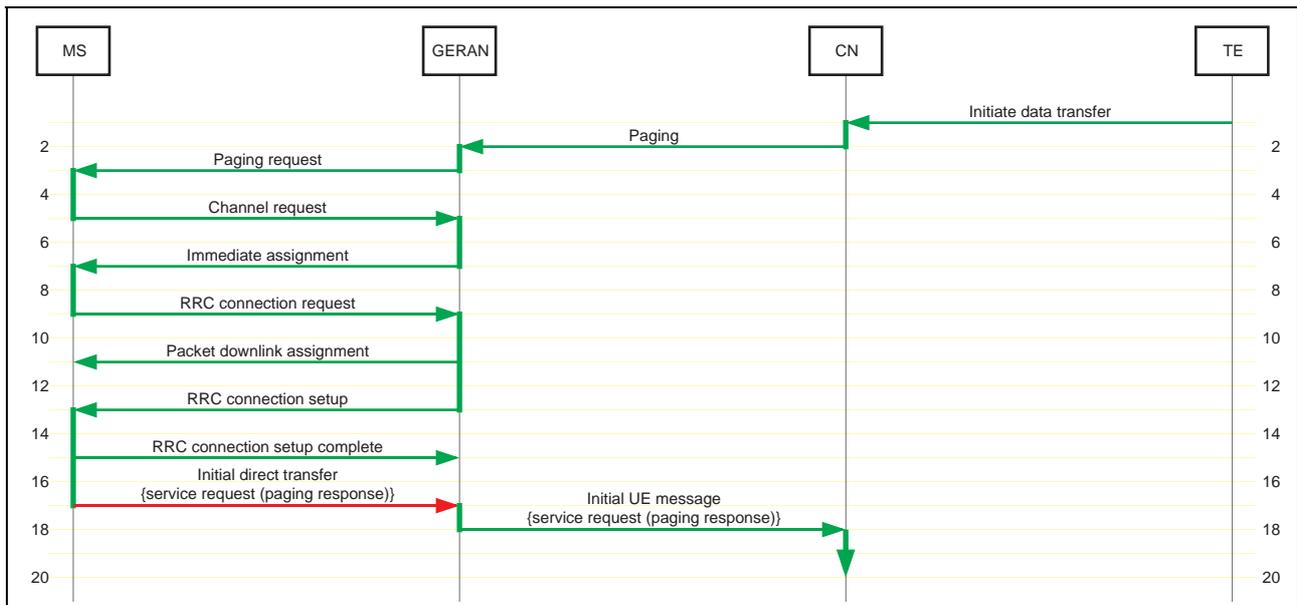

9 This sequence corresponds to the following user-based scenario:

- 10 • Lloyd receives an e-mail order confirmation.

11 Figure 7 shows the paging-related portion of an incoming data transfer under the following conditions:

- 12 • RRC is in *RRC-Idle* mode.
- 13 • MM is in *MM-Idle* state.
- 14 • PMM is in *PMM-Idle* state.
- 15 • Mobile station is camped on a CCCH.

Figure 7: Incoming data transfer – RRC-Idle, CCCH, assign TBF

Line	Description	Direction Protocol Channel
1	Initiate data transfer Lloyd's server sends an e-mail confirming a customer order.	CN←TE

### 2 2.4.3 Incoming data transfer – *RRC-GRA\_PCH*, CCCH

3 This sequence corresponds to the following user-based scenario:

- 4 • Lloyd receives an e-mail order confirmation.

5 Figure 9 shows the paging-related portion of an incoming data transfer under the following conditions:

- 6 • RRC is in *RRC-GRA\_PCH* state.
- 7 • MM is in *MM-Idle* state.
- 8 • PMM is in *PMM-Connected* state.
- 9 • Mobile station is monitoring a CCCH.

Figure 9: Incoming data transfer – RRC-*GRA\_PCH*, CCCH, assign TBF

Line	Description	Direction Protocol Channel
1	Initiate data transfer Lloyd's server sends an e-mail confirming a customer order.	CN←TE
2	Data PDU Since the CN still has an <i>Iu</i> connection for this mobile station, it forwards the data to GERAN.	GERAN←CN GTP <i>Iu-ps</i>
3	Paging request <i>{page mode, channel needed, mobile identity, P1 rest octets}</i> Since the GERAN RRC is in <i>GRA_PCH</i> state for this IMSI, it knows where the mobile station is within a GERAN registration area. It therefore sends a <i>paging request</i> on all paging channels in the GRA. Upon receipt of the <i>paging request</i> , the MS RRC informs its non-access stratum that the core network has paged it. The MS NAS responds to the page. <ul style="list-style-type: none"> <li><i>Channel needed</i> indicates any channel.</li> <li><i>Mobile identity</i> is the mobile station's G-RNTI.</li> <li><i>P1 rest octets</i> indicates <i>packet-paging procedure</i>. &lt;Presently, RRC only includes this information if <i>mobile identity</i> is IMSI.&gt;</li> </ul> The following should be added to the <i>paging request</i> : <ul style="list-style-type: none"> <li>An indication of which network element initiated the page: CN or GERAN.</li> <li>An indication of which core network initiated the page: circuit-domain or packet-domain.</li> <li>G-RNTI coding in <i>mobile identity</i>.</li> <li><i>P1 rest octets</i> applies when paging with G-RNTI. This applies for <i>paging request type 1</i>. <i>P2 rest octets</i> should also be updated for <i>paging request type 2</i>.</li> </ul>	MS←GERAN RRC CCCH (PCH)
5	Channel request <i>{establishment cause, random reference}</i> Same as § 2.4.1 line 5.	MS→GERAN RRC CCCH (RACH)
7	Immediate assignment <i>{page mode, dedicated mode or TBF, packet-channel description, request reference, timing advance, mobile allocation, starting time, IA rest octets (packet uplink assignment)}</i> Same as § 2.4.1 line 7.	MS←GERAN RRC CCCH (AGCH)
9	Cell update <i>{U-RNTI, START list, AM_RLC error indication (RB2 or RB3), AM_RLC error indication (RB4 and upwards), cell-update cause, RB-timer indicator}</i> Same as § 2.1.3 line 9 except for the following: <ul style="list-style-type: none"> <li><i>START list</i> identifies the CN domain (packet) and initializes the 20 most-significant bits of the hyperframe numbers.</li> </ul>	MS→GERAN RRC RB1 (PDTCH)

11	Packet downlink assignment <i>{page mode, persistence level, global TFI, MAC mode, RLC mode, control ack, timeslot allocation, packet timing advance, P0, BTS pwr-control mode, PR mode, frequency parameters, downlink TFI assignment, power-control parameters, TBF starting time, measurement mapping}</i> Same as § 2.4.1 line 11.	MS←GERAN MAC PACCH
13	Cell update confirm <i>{RRC transaction identifier, activation time, RRC state indicator, UTRAN DRX cycle length coefficient, RLC re-establish indicator (RB2 and RB3), RLC re-establish indicator (RB4 and upwards), &lt;channel and radio-resource configuration information elements (reams of information elements of dubious usefulness)&gt;}</i> Same as § 2.1.3 line 11 except for the following: <ul style="list-style-type: none"> <li>• <i>RRC state indicator</i> specifies that the mobile station enter <i>RRC Cell Shared</i> state.</li> </ul>	MS←GERAN RRC RB1 (PDTCH)
15	Data PDU GERAN forwards the data to the MS.	MS←GERAN PDCP RB5 (PDTCH)

13	Cell update confirm {RRC transaction identifier, activation time, RRC state indicator, UTRAN DRX cycle length coefficient, RLC re-establish indicator (RB2 and RB3), RLC re-establish indicator (RB4 and upwards), <channel and radio-resource configuration information elements (reams of information elements of dubious usefulness)>} Same as § 2.4.3 line 13.	MS←GERAN RRC RB1 (PDTCH)

15	Data PDU GERAN forwards the data to the MS.	MS←GERAN PDCP RB5 (PDTCH)
----	--	---------------------------------

## 3. Impact on specifications

This section is preliminary; it is incomplete.

### 3.1 Changes to 23.060 (GPRS stage 2)

Section	Description

### 3.2 Changes to 24.008 (CN protocols)

Section	Description
10.5.1.4	Add G-RNTI as a <i>mobile identity</i> .

### 3.3 Changes to 25.413 (UTRAN RANAP)

Section	Description
3.3	Abbreviations Add GERAN. Add <i>mobile station</i> to definition of UE.
8.15	Paging Update section to include GERAN paging. Add <i>SPLIT_PG_CYCLE</i> .
9.1.23	Paging Add <i>SPLIT_PG_CYCLE</i> .
9.2	Information-element definitions Add <i>SPLIT_PG_CYCLE</i> .

## 3.4 Changes to 44.018 (GERAN RRC)

This section proposes changes to GP-011262 (*Draft CR to 44.018 due to RRC Part 1* [Nokia]) and GP-011196 (*Draft CR to 44.018 due to RRC Part 2* [Nokia]).

Section	Description
3.3.2.1	Paging initiation by the network <Do we need to specify what to do with new information elements in the <i>paging requests</i> ?>
3.3.2.2	Paging response <Changes to this section specify the following: In <i>Iu mode</i> , the upper layer is informed that RRC entity entered the <i>RRC-Cell_Dedicated</i> state. RRC does not enter this state until the RRC connection is established, long after the <i>paging response</i> .>
3.5.1.1	Packet paging initiation by the network <Do we need to specify what to do with new information elements in the <i>packet paging request</i> ?>
3.4	Procedures in RR dedicated mode ... Add subsection specifying paging in <i>RRC-Cell_Dedicated</i> state. See 25.331 § 8.1.11, <i>UE dedicated paging</i> . <How does this relate to 44.018 § 3.4.22.2, <i>Packet notification procedure in dedicated mode</i> ?>
9.1	Paging Add a paging message based on 25.331 <i>paging type 2</i> .
9.1.22	Paging request type 1 For both mobile identities, add the following to the <i>paging request type 1</i> : <ul style="list-style-type: none"> <li>An indication of which network element initiated the page: CN or GERAN.</li> <li>An indication of which core network initiated the page: circuit-domain or packet-domain. If paging with IMSI, this element must be included. If paging with P-TMSI or TMSI, the element could be omitted since the identity could implicitly indicate the network initiating the page. If this information element is always included, the mobile station could be paged in one domain (<i>e.g.</i>, circuit) using an available temporary identity from the other domain (<i>e.g.</i>, P-TMSI).</li> <li><i>Paging cause</i> from the RANAP <i>paging</i> message.</li> </ul> <Do we have enough message length to modify <i>paging request type 1</i> , <i>type 2</i> , and <i>type 3</i> ? If not, we may want to define a new <i>Iu-mode</i> paging message.>
9.1.23	Paging request type 2 Add the following to the <i>paging request type 2</i> : <ul style="list-style-type: none"> <li>For mobile identities 1 through 3, an indication of which network element initiated the page: CN or GERAN.</li> <li>For <i>mobile identity 3</i>, an indication of which core network initiated the page: circuit-domain or packet-domain. If paging with IMSI, this element must be included. If paging with P-TMSI or TMSI, the element could be omitted since the identity could implicitly indicate the network initiating the page.</li> <li>For mobile identities 1 through 3, <i>paging cause</i> from the RANAP <i>paging</i> message.</li> </ul>
9.1.24	Paging request type 3 For all four mobile identities, add the following to the <i>paging request type 3</i> : <ul style="list-style-type: none"> <li>An indication of which network element initiated the page: CN or GERAN.</li> <li><i>Paging cause</i> from the RANAP <i>paging</i> message.</li> </ul>
?	RRC connection setup Add the following to the <i>RRC connection setup</i> message: <ul style="list-style-type: none"> <li><i>GERAN_SPLIT_PG_CYCLE</i>. This parameter performs for GPRS-attached mobile stations a similar function to the <i>UTRAN DRX cycle-length coefficient</i>.</li> </ul>
10.5.2.23	P1 rest octets <i>Packet page indication 1</i> applies when paging with G-RNTI.
10.5.2.24	P2 rest octets <i>Packet page indication 3</i> applies when paging with G-RNTI.

### 1 3.5 Changes to 44.060 (GERAN RLC/MAC)

Section	Description
6	Paging procedures Change title to <i>Paging procedures in A/Gb mode</i> .
6a	Add new section: <i>Paging procedures in Iu mode</i> .
11.2.10	Packet paging request Add the following information elements to the <i>packet paging request</i> : <ul style="list-style-type: none"> <li>• An indication of which network element initiated the page: CN or GERAN.</li> <li>• An indication of which core network initiated the page: circuit-domain or packet-domain. If paging with IMSI, this element must be included. If paging with P-TMSI or TMSI, the element could be omitted since the identity could implicitly indicate the network initiating the page. If this information element is always included, the mobile station could be paged in one domain (<i>e.g.</i>, circuit) using an available temporary identity from the other domain (<i>e.g.</i>, P-TMSI).</li> <li>• <i>Paging cause</i> from the RANAP <i>paging</i> message.</li> <li>• G-RNTI as a <i>mobile identity</i>.</li> </ul>
12	Information-element coding

---

## 1 A. Network-operation modes

### 2 A.1 GPRS

3 GPRS operates in one of three modes:

- 4 • *Mode I* has a *Gs* interface between MSC and SGSN. For mobile stations attached to both domains, the MSC sends circuit pages via the SGSN, *i.e.*, a BSSGP paging message on the *Gb* interface. The SGSN sends packet pages directly to the BSS, *i.e.*, a BSSGP paging message on the *Gb* interface. The BSS pages the mobile station via the following channel: PACCH if available, else PCCCH if available, else CCCH.
- 8 • *Mode II* has no *Gs* interface between MSC and SGSN. The MSC sends circuit pages directly to the BSS, *i.e.*, a BSSAP paging message on the *A* interface. The SGSN sends circuit pages directly to the BSS, *i.e.*, a BSSGP paging message on the *Gb* interface. The BSS pages the mobile station via the CCCH.
- 11 • *Mode III* has no *Gs* interface between MSC and SGSN. The MSC sends circuit pages directly to the BSS, *i.e.*, a BSSAP paging message on the *A* interface. The SGSN sends circuit pages directly to the BSS, *i.e.*, a BSSGP paging message on the *Gb* interface. The BSS sends circuit pages via the CCCH. It sends packet pages via the PCCCH if available, else CCCH.

### 15 A.2 UMTS

16 UMTS operates in one of two modes:

- 17 • *Mode I* has a *Gs* interface between MSC and SGSN. For mobile stations attached to both domains, the MSC sends circuit pages via the SGSN, *i.e.*, a RANAP paging message on the *Iu-ps* interface. The SGSN sends packet pages directly to UTRAN, *i.e.*, a RANAP paging message on the *Iu-ps* interface.
- 20 • *Mode II* has no *Gs* interface between MSC and SGSN. The MSC sends circuit pages directly to UTRAN, *i.e.*, a RANAP paging message on the *Iu-cs* interface. The SGSN sends packet pages directly to UTRAN, *i.e.*, a RANAP paging message on the *Iu-ps* interface.

### 23 A.3 GERAN

24 This concept paper proposes that GERAN operate in any one of the following modes:

- 25 • *Mode I* has a *Gs* interface between MSC and SGSN. For mobile stations attached to both domains, the MSC sends circuit pages via the SGSN, *i.e.*, a RANAP paging message on the *Iu-ps* interface. The SGSN sends packet pages directly to the GERAN, *i.e.*, a RANAP paging message on the *Iu-ps* interface. GERAN pages the mobile station via the following channel: PACCH if available, else PCCCH.
- 29 • *Mode II* has no *Gs* interface between MSC and SGSN. The MSC sends circuit pages directly to GERAN, *i.e.*, a RANAP paging message on the *Iu-cs* interface. The SGSN sends packet pages directly to GERAN, *i.e.*, a RANAP paging message on the *Iu-ps* interface. GERAN pages the mobile station via the following channel: PACCH if available, else PCCCH if available, else CCCH.

33 <Why do we need any mode other than *Mode I*, especially if we want DRX to work?>

---

## 1 B. Paging equations

2 This annex describes several complicated methods of hashing mobile stations over available paging channels. Why  
3 wasn't one simple method good enough? It's not the ETSI/3GPP way: never use a nail when you can specify  
4 multidimensional impact-inserted flexible attachment functionality.

### 5 B.1 CCCH

6 3GPP TS 45.002 [10] specifies the information on which these equations are based.

#### 7 B.1.1 Paging blocks per CCCH multiframe ( $N_m$ )

8 The following equation calculates the number of paging blocks per CCCH 51-multiframe.

$$9 \quad N_m = 9 - 6 * BS\_CCCH\_SDCCH\_COMB - BS\_AG\_BLKS\_RES$$

10 where:

11  $N_m$  = number of paging blocks per CCCH 51-multiframe.

12  $BS\_CCCH\_SDCCH\_COMB$  = SDCCH combined with CCCH (1) or not (0). Broadcast variable  
13 ( $CCCH\_CONF$ ).

14  $BS\_AG\_BLKS\_RES$  = number of blocks per common control channel not available for paging (0 to 7).  
15 Broadcast variable.

#### 16 B.1.2 Paging blocks per CCCH ( $N_c$ , $M_c$ )

17 For GPRS-detached mobile stations, the following equation calculates the number of paging blocks per CCCH.

$$18 \quad N_c = BS\_PA\_MFRMS * N_m$$

19 where:

20  $N_c$  = number of paging blocks per common control channel.

21  $BS\_PA\_MFRMS$  = number of 51-multiframes between pages to the same mobile station (2 to 9).  
22 Broadcast variable.

23  $N_m$  = number of paging blocks per CCCH 51-multiframe.

24  
25 For GPRS-attached mobile stations, the following equation calculates the number of packet paging blocks per CCCH. If  
26 the CCCH does not support this type of paging, the preceding equation applies.

$$27 \quad M_c = 64 * N_m$$

28 where:

29  $M_c$  = number of packet paging blocks per common control channel.

30  $N_m$  = number of paging blocks per CCCH 51-multiframe.

### 1 B.1.3 Paging blocks per cell ( $N_t$ , $M_t$ )

2 For GPRS-detached mobile stations, the following equation calculates the number of paging blocks for all common  
3 control channels in a cell.

$$4 \quad N_t = BS\_CC\_CHANS * N_c$$

5 where:

6  $N_t$  = total number of paging blocks per cell.

7  $BS\_CC\_CHANS$  = number of common control channels (1 to 4). Broadcast variable  
8 ( $CCCH\_CONF$ ).

9  $N_c$  = number of paging blocks per common control channel.

10

11 For GPRS-attached mobile stations, the following equation calculates the number of packet paging blocks for all  
12 common control channels in a cell. If the CCCH does not support this type of paging, the preceding equation applies.

$$13 \quad M_t = BS\_CC\_CHANS * M_c$$

14 where:

15  $M_t$  = total number of packet paging blocks per cell.

16  $BS\_CC\_CHANS$  = number of common control channels (1 to 4). Broadcast variable  
17 ( $CCCH\_CONF$ ).

18  $M_c$  = number of packet paging blocks per common control channel.

### 19 B.1.4 Monitored CCCH

20 The following equation calculates which CCCH a mobile station shall monitor.

$$21 \quad CCCH\_GROUP = [(IMSI \bmod 1000) \bmod N_t] \text{ div } N_c$$

22 where:

23  $CCCH\_GROUP$  = the common control channel to be monitored by the mobile station (0 to  
24  $BS\_CC\_CHANS - 1$ ).

25  $IMSI$  = international mobile-subscriber identity.

26  $N_t$  = total number of paging blocks per cell.

27  $N_c$  = number of paging blocks per common control channel.

28 <Why does this hash function require three modulo or div operations instead of just one modulo operation based on the  
29 number of CCCHs, i.e.,  $CCCH\_GROUP = IMSI \bmod BS\_CC\_CHANS$ ?>

## 1 B.1.5 Monitored paging block on CCCH

2 For GPRS-detached mobile stations, the following equation calculates which paging block to monitor on the monitored  
3 common control channel.

$$4 \quad PAGING\_GROUP = [(IMSI \bmod 1000) \bmod N_t] \bmod N_c$$

5 where:

6  $PAGING\_GROUP$  = the group of paging blocks the mobile station shall monitor.

7  $IMSI$  = international mobile-subscriber identity.

8  $N_t$  = total number of paging blocks per cell.

9  $N_c$  = number of paging blocks per common control channel.

10  
11 For GPRS-attached mobile stations, the following equation calculates which paging block to monitor on the monitored  
12 common control channel. If the CCCH does not support this type of paging, the preceding equation applies.

$$13 \quad PAGING\_GROUP = \left( \begin{array}{l} [(IMSI \bmod 1000) \operatorname{div} N_t] * N_c + \\ (IMSI \bmod 1000) \bmod N_c + \\ \max[(m * M_c) \operatorname{div} SPLIT\_PG\_CYCLE, m] \end{array} \right) \bmod M_c$$

14 where:

15  $PAGING\_GROUP$  = the group of paging blocks the mobile station shall monitor.

16  $IMSI$  = international mobile-subscriber identity.

17  $N_t$  = total number of paging blocks per cell.

18  $N_c$  = number of paging blocks per common control channel.

19  $m$  = 0, 1 ...  $\min(M_c, SPLIT\_PG\_CYCLE) - 1$ .

20  $M_c$  = number of packet paging blocks per common control channel.

21  $SPLIT\_PG\_CYCLE$  = the divisor for the period between pages to a mobile station, where the period is  
22 expressed in  $M_c$  packet paging blocks, *e.g.*: if  $SPLIT\_PG\_CYCLE = 1$ , GERAN  
23 will page the mobile station every  $M_c$  blocks (every 64 multiframes); if  
24  $SPLIT\_PG\_CYCLE = 2$ , GERAN will page the mobile station every  $M_c/2$  blocks  
25 (every 32 multiframes); if  $SPLIT\_PG\_CYCLE = 64$ , GERAN will page the  
26 mobile station every  $M_c/64$  blocks (every multiframe). Any time  
27  $SPLIT\_PG\_CYCLE$  is set greater than or equal to  $M_c$ , GERAN will page the  
28 mobile station in every packet paging block. GERAN and the mobile station  
29 establish the value of  $SPLIT\_PG\_CYCLE$  during GPRS attach.  
30  $SPLIT\_PG\_CYCLE$  can take one of the following values: 1 to 64, 71, 72, 74 ...  
31 352, 704. For the CCCH,  $SPLIT\_PG\_CYCLE$  is not allowed to exceed 32.

## 1 B.1.6 Paging multiframe

2 For GPRS-detached mobile stations, when the following equation is true, the mobile station may be paged within the  
3 multiframe containing  $FN$ .

$$4 \quad PAGING\_GROUP \operatorname{div} N_m = (FN \operatorname{div} 51) \operatorname{mod}(BS\_PA\_MFRMS)$$

5 where:

6  $PAGING\_GROUP$  = the group of paging blocks the mobile station shall monitor.

7  $N_m$  = number of paging blocks per CCCH 51-multiframe.

8  $FN$  = frame number.

9  $BS\_PA\_MFRMS$  = number of 51-multiframes between pages to the same mobile station (2 to 9).  
10 Broadcast variable.

11

12 For GPRS-attached mobile stations, when the following equation is true, the mobile station may be paged within the  
13 multiframe containing  $FN$ . If the CCCH does not support this type of paging, the preceding equation applies.

$$14 \quad PAGING\_GROUP \operatorname{div} N_m = (FN \operatorname{div} 51) \operatorname{mod} 64$$

15 where:

16  $PAGING\_GROUP$  = the group of paging blocks the mobile station shall monitor.

17  $N_m$  = number of paging blocks per CCCH 51-multiframe.

18  $FN$  = frame number.

## 19 B.1.7 Paging-block index ( $i$ )

20 The following equation calculates the index to the paging block in which the mobile station may be paged, *i.e.*, a  
21 calculated value of 0 indicates B0 (block 0).

$$22 \quad i = PAGING\_GROUP \operatorname{mod} N_m$$

23 where:

24  $i$  = the index to the paging block within the 51-multiframe.

25  $PAGING\_GROUP$  = the group of paging blocks the mobile station shall monitor.

26  $N_m$  = number of paging blocks per CCCH 51-multiframe.

## 1 B.2 PCCCH

2 3GPP TS 45.002 [10] specifies the information on which these equations are based.

### 3 B.2.1 Paging blocks per PCCCH multiframe ( $N_{pm}$ )

4 The following equation calculates the number of paging blocks per PCCCH 52-multiframe.

$$5 N_{pm} = 12 - BS\_PAG\_BLKS\_RES - BS\_PBCCH\_BLKS$$

6 where:

7  $N_{pm}$  = number of paging blocks per PCCCH 52-multiframe.

8  $BS\_PAG\_BLKS\_RES$  = number of blocks per PCCCH not available for paging (0 to 12). Broadcast  
9 variable.

10  $BS\_PBCCH\_BLKS$  = number of blocks per 52-multiframe reserved for PBCCH. Broadcast variable.

### 11 B.2.2 Paging blocks per PCCCH ( $M_{pc}$ )

12 The following equation calculates the number of paging blocks per PCCCH.

$$13 M_{pc} = 64 * N_{pm}$$

14 where:

15  $M_{pc}$  = number of paging blocks per PCCCH.

16  $N_{pm}$  = number of paging blocks per PCCCH 52-multiframe.

### 17 B.2.3 Paging blocks per cell ( $N_{pt}$ )

18 The following equation calculates the number of paging blocks for all PCCCHs in a cell.

$$19 N_{pt} = BS\_PCC\_CHANS * M_{pc}$$

20 where:

21  $N_{pt}$  = total number of paging blocks per cell.

22  $BS\_PCC\_CHANS$  = number of PCCCHs (1 to 16). Broadcast variable.

23  $M_{pc}$  = number of paging blocks per PCCCH.

### 24 B.2.4 Monitored PCCCH

25 The following equation calculates which PCCCH a mobile station shall monitor.

$$26 PCCCH\_GROUP = (IMSI \bmod 1000) \bmod BS\_PCC\_CHANS$$

27 where:

28  $PCCCH\_GROUP$  = the PCCCH to be monitored by the mobile station (0 to  $BS\_PCC\_CHANS - 1$ ).

29  $BS\_PCC\_CHANS$  = number of PCCCHs (1 to 16). Broadcast variable.

## 1 B.2.5 Monitored paging block on PCCCH

2 The following equation calculates which paging block a GPRS-attached mobile station shall monitor on the monitored  
3 PCCCH.

$$4 \quad PAGING\_GROUP = \left( \begin{array}{l} [(IMSI \bmod 1000) \operatorname{div} N_{pt}] * N_{pc} + \\ (IMSI \bmod 1000) \bmod N_{pc} + \\ \max[(m * M_{pc}) \operatorname{div} SPLIT\_PG\_CYCLE, m] \end{array} \right) \bmod M_{pc}$$

5 where:

6  $PAGING\_GROUP$  = the group of packet paging blocks the mobile station shall monitor.

7  $IMSI$  = international mobile-subscriber identity.

8  $N_{pt}$  = total number of packet paging blocks per cell.

9  $N_{pc}$  = number of paging blocks per PCCCH.

10  $m$  = 0, 1 ...  $\min(M_{pc}, SPLIT\_PG\_CYCLE) - 1$ .

11  $M_{pc}$  = number of paging blocks per PCCCH.

## 12 B.2.6 Paging multiframe

13 When the following equation is true, the mobile station may be paged within the multiframe containing  $FN$ .

$$14 \quad PAGING\_GROUP \operatorname{div} N_{pm} = (FN \operatorname{div} 52) \bmod 64$$

15 where:

16  $PAGING\_GROUP$  = the group of paging blocks the mobile station shall monitor.

17  $N_{pm}$  = number of paging blocks per PCCCH 52-multiframe.

18  $FN$  = frame number.

## 19 B.2.7 Paging-block index ( $i$ )

20 The following equation calculates the index to the paging block in which the mobile station may be paged, *i.e.*, a  
21 calculated value of 0 indicates B0 (block 0).

$$22 \quad i = PAGING\_GROUP \bmod N_{pm}$$

23 where:

24  $i$  = the index to the paging block within the 52-multiframe.

25  $PAGING\_GROUP$  = the group of paging blocks the mobile station shall monitor.

26  $N_{pm}$  = number of paging blocks per PCCCH 52-multiframe.

## 1 B.3 UTRAN

2 The following equation calculates the system frame number of the first frame of the paging block in which the mobile  
3 station will be paged [4].

$$4 \quad P = [(IMSI \text{ div } K) \bmod(DRX \text{ div } PBP) * PBP] + [n * DRX] + Fo$$

5 where:

6  $P$  = system frame number of the first frame of the paging block in which the mobile  
7 station will be paged.

8  $IMSI$  = international mobile-subscriber identity.

9  $K$  = number of paging channels.

10  $DRX$  = DRX cycle length calculated as follows:  $DRX = \max(2^k, PBP)$ , where  $k$  is the  
11  $DRX$  cycle-length coefficient (an integer from 6 to 9) and  $PBP$  is the paging  
12 block period specified below. Also, see the discussion in § B.4.

13  $PBP$  = paging block period.  $PBP = 1$  for frequency-division duplex.

14  $n$  = non-negative integer.

15  $Fo$  = frame offset.

## 16 B.4 DRX values for UTRAN

17 In *RRC Idle* mode, the UE shall use the following for *DRX*:

- 18 • The stored DRX cycle length for any CN domain to which the UE is attached. <Shouldn't the UE use the  
19 shortest DRX cycle length?>

20 In *RRC Connected* mode, the UE shall use the shortest of the following for *DRX*:

- 21 • The UTRAN DRX cycle length calculated using the *UTRAN DRX cycle-length coefficient*. This coefficient  
22 appears in several RRC messages, e.g., *Radio-Bearer Setup* and *Radio-Bearer Reconfiguration*.
- 23 • The stored DRX cycle length for any CN domain to which the UE is attached but not connected. <Shouldn't this  
24 be the shortest stored DRX cycle length, not any stored value?>

25 The UE could be attached to two CN domains, circuit and packet, each having their own DRX cycle lengths. For the  
26 circuit domain, the UE uses the circuit-domain *CN-domain-specific DRX cycle-length coefficient* broadcast in system  
27 information. For the packet domain, the UE negotiates the DRX cycle length during attachment. If no DRX cycle length  
28 has been negotiated, the UE uses the packet-domain *CN-domain-specific DRX cycle-length coefficient* broadcast in  
29 system information.

---

## 1 C. States

2 This annex plagiarizes GP-010679 [13] and G2-010063 [11].

### 3 C.1 MM states

4 *Mobility management* applies to the circuit domain. One MM state machine resides in each mobile station. For each  
5 mobile station, one MM state machine resides in the core network. The MM state machine has the following states:

- 6 • *MM-Detached*.  
7 The core network cannot reach the mobile station for circuit services.
- 8 • *MM-Idle*.  
9 The core network can reach the mobile station via paging.
- 10 • *MM-Connected*.  
11 The core network supplies circuit services via a signalling connection between the core network and the mobile  
12 station. A signalling connection comprises a *Um* connection between MS and GERAN and an *Iu-cs* connection  
13 between GERAN and CN.

### 14 C.2 PMM states

15 *Packet mobility management* applies to the packet domain. One PMM state machine resides in each mobile station. For  
16 each mobile station, one PMM state machine resides in the core network. The PMM state machine has the following  
17 states:

- 18 • *PMM-Detached*.  
19 The core network cannot reach the mobile station for packet services.
- 20 • *PMM-Idle*.  
21 The core network can reach the mobile station via paging.
- 22 • *PMM-Connected*.  
23 The core network supplies packet services via a signalling connection between the core network and the mobile  
24 station. A signalling connection comprises a *Um* connection between MS and GERAN and an *Iu-ps* connection  
25 between GERAN and CN.

### 26 C.3 RCC modes

27 *Radio-resource control* applies to the circuit and packet domains. One RRC state machine resides in each mobile  
28 station. For each mobile station, one RRC state machine resides in the GERAN. The RRC state machine has two high-  
29 level states — for some obscure reason, called modes:

- 30 • *RRC-Idle*.  
31 No signalling connection exists between mobile station and GERAN. GERAN may be able to reach the mobile  
32 station via paging. In this state (mode), both of the following will be true: MM is not in *MM-Connected state*;  
33 PMM is not in *PMM-Connected state*.

34 Upon receipt of a RANAP *paging* message, GERAN pages the mobile station using a core-network identifier  
35 (IMSI, TSML, or P-TMSI). Paging triggers the mobile station to establish an RRC connection and then send an  
36 NAS (non-access stratum) paging response to the core network.

37 If the mobile station camps on a CCCH, RRC pages the mobile station. If the mobile station camps on PCCCH,  
38 RRC requests that MAC page the mobile station.

- 39 • *RRC-Connected*.  
40 A signalling connection exists between mobile station and GERAN. In this state (mode), one or more of the  
41 following will be true: MM is in *MM-Connected state*; PMM is in *PMM-Connected state*.

## 1 C.4 RRC states

2 In *RRC Connected* mode, RRC is in one of the following states:

- 3 • *RRC-GRA\_PCH.*

4 GERAN knows the mobile-station location to a GRA (GERAN registration area). RRC has allocated no physical  
5 subchannels.

6 Upon receipt of a RANAP *paging* message, GERAN pages the mobile station using a GERAN identifier  
7 (G-RNTI). Paging triggers the mobile station to perform a cell update and then send an NAS paging response to  
8 the core network.

9 Upon receipt of a downlink PDU, GERAN pages the mobile station using a GERAN identifier (G-RNTI).  
10 Paging triggers the mobile station to perform a cell update. Once GERAN knows which cell serves the mobile  
11 station, it forwards the downlink PDU.

12 If the mobile station camps on a CCCH, RRC pages the mobile station. If the mobile station camps on PCCCH,  
13 RRC requests that MAC page the mobile station.

- 14 • *RRC-Cell\_Shared.*

15 GERAN knows the mobile-station location to the cell where the mobile station last performed a cell update.  
16 RRC has allocated no dedicated physical subchannels. It has allocated one or more shared physical subchannels;  
17 however, TBFs may be active (*MAC Shared* state) or may not be active (*MAC Idle* state).

18 Upon receipt of a RANAP *paging* message, GERAN pages the mobile station using a GERAN identifier  
19 (G-RNTI). Paging triggers the mobile station to send an NAS paging response to the core network. <Should the  
20 mobile station perform a cell update? If so, why?>

21 If the mobile station is in *MAC Shared* state, it monitors PACCH; RRC pages. If the mobile station is in *MAC*  
22 *Idle* state and it camps on a CCCH, RRC pages. If the mobile station is in *MAC Idle* state and it camps on a  
23 PCCCH, RRC requests that MAC page.

- 24 • *RRC-Cell\_Dedicated.*

25 GERAN knows the mobile-station location to a cell. RRC has allocated one or more dedicated physical  
26 subchannels and zero or more shared physical subchannels.

27 Upon receipt of a RANAP *paging* message, GERAN pages the mobile station using a GERAN identifier  
28 (G-RNTI). Paging triggers the mobile station to send an NAS paging response to the core network.

29 RRC pages the mobile station using a dedicated control channel.
