**Specification of the MILENAGE Algorithm Set:
an Example Algorithm Set for the 3GPP
Authentication and Key Generation Functions $f1, f1^*,$
 $f2, f3, f4, f5$ and $f5^*$**

Document 3: Design Conformance Test Data

Document History		
1.0	22nd November 2000	Initial Release

PREFACE

This document has been prepared by the 3GPP Task Force, and contains an example set of algorithms which may be used as the authentication and key generation functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$. (It is not mandatory that the particular algorithms specified in this document are used — all seven functions are operator-specifiable rather than being fully standardized.)

This document is the third of three, which between them form the entire specification of the example algorithms:

- Specification of the MILENAGE Algorithm Set: an Example Algorithm Set for the 3GPP Authentication and Key Generation Functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$.
Document 1: Algorithm Specification.
- Specification of the MILENAGE Algorithm Set: an Example Algorithm Set for the 3GPP Authentication and Key Generation Functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$.
Document 2: Implementors' Test Data.
- Specification of the MILENAGE Algorithm Set: an Example Algorithm Set for the 3GPP Authentication and Key Generation Functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$.

1. OUTLINE OF THE DESIGN CONFORMANCE TEST DATA

Section 2 introduces the algorithms and describes the notation used in the subsequent sections.

Section 3 provides test data for the cryptographic kernel function Rijndael.

Section 4 provides test data for the MILENAGE authentication and key generation algorithms $f1, f1^*, f2, f3, f4, f5$ and $f5^*$.

2. INTRODUCTORY INFORMATION

2.1. Introduction

Within the security architecture of the 3GPP system there are seven security functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$. The operation of these functions falls within the domain of one operator, and the functions are therefore to be specified by each operator rather than being fully standardized. The algorithms specified in this document are examples that may be used by an operator who does not wish to design his own.

The inputs and outputs of all seven algorithms are defined in section 2.5.

This document provides sets of input/output test data for ‘black box’ testing of physical realizations of all algorithms.

2.2. Radix

Unless stated otherwise, all test data values presented in this document are in hexadecimal.

2.3. Bit/Byte ordering

All data variables in this specification are presented with the most significant bit (or byte) on the left hand side and the least significant bit (or byte) on the right hand side. Where a variable is broken down into a number of substrings, the leftmost (most significant) substring is numbered 0, the next most significant is numbered 1, and so on through to the least significant.

2.4. List of Variables

AK	a 48-bit anonymity key that is the output of either of the functions $f5$ and $f5^*$.
AMF	a 16-bit authentication management field that is an input to the functions $f1$ and $f1^*$.
c1,c2,c3,c4,c5	128-bit constants, which are XORed onto intermediate variables.
CK	a 128-bit confidentiality key that is the output of the function $f3$.
IK	a 128-bit integrity key that is the output of the function $f4$.
K	a 128-bit subscriber key that is an input to the functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$.
MAC-A	a 64-bit network authentication code that is the output of the function $f1$.

MAC-S	a 64-bit resynchronisation authentication code that is the output of the function $f1^*$.
OP	a 128-bit Operator Variant Algorithm Configuration Field that is a component of the functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$.
OP_C	a 128-bit value derived from OP and K and used within the computation of the functions.
$r1, r2, r3, r4, r5$	integers in the range 0–127 inclusive, which define amounts by which intermediate variables are cyclically rotated.
RAND	a 128-bit random challenge that is an input to the functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$.
RES	a 64-bit signed response that is the output of the function $f2$.
SQN	a 48-bit sequence number that is an input to either of the functions $f1$ and $f1^*$. (For $f1^*$ this input is more precisely called SQN_{MS} .)

2.5. Algorithm Inputs and Outputs

The inputs to the algorithms are given in tables 1 and 2, the outputs in tables 3–9 below.

Parameter	Size (bits)	Comment
K	128	Subscriber key K[0]...K[127]
RAND	128	Random challenge RAND[0]...RAND[127]
SQN	48	Sequence number SQN[0]...SQN[47]. (For $f1^*$ this input is more precisely called SQN_{MS})
AMF	16	Authentication management field AMF[0]...AMF[15]

Table 1. inputs to $f1$ and $f1^*$

Parameter	Size (bits)	Comment
K	128	Subscriber key K[0]...K[127]
RAND	128	Random challenge RAND[0]...RAND[127]

Table 2. inputs to $f2, f3, f4, f5$ and $f5^*$

Parameter	Size (bits)	Comment
MAC-A	64	Network authentication code MAC-A[0]...MAC-A[63]

Table 3. $f1$ output

Parameter	Size (bits)	Comment
MAC-S	64	Resynch authentication code MAC-S[0]...MAC-S[63]

Table 4. $f1^*$ output

Parameter	Size (bits)	Comment
RES	64	Response RES[0]...RES[63]

Table 5. *f2* output

Parameter	Size (bits)	Comment
CK	128	Confidentiality key CK[0]...CK[127]

Table 6. *f3* output

Parameter	Size (bits)	Comment
IK	128	Integrity key IK[0]...IK[127]

Table 7. *f4* output

Parameter	Size (bits)	Comment
AK	48	Anonymity key AK[0]...AK[47]

Table 8. *f5* output

Parameter	Size (bits)	Comment
AK	48	Resynch anonymity key AK[0]...AK[47]

Table 9. *f5** output

Note: Both f5 and f5* outputs are called AK according to reference [2]. In practice only one of them will be calculated in each instance of the authentication and key agreement procedure.

2.6. Coverage

For each of the algorithms the test data sets have been selected such that, provided the entire set of tests is run:

- Each input bit of the Rijndael kernel function will have been in both the ‘0’ and ‘1’ states.
- Each input bit of the modes (RAND, K, SQN, AMF) will have been in both the ‘0’ and ‘1’ states.
- Every S-Box entry of the Rijndael kernel function will have been used.

3. CONFORMANCE TEST DATA FOR RIJNDAEL

3.1. Overview

The test data sets presented here are for the cryptographic kernel function Rijndael. The first 6 test sets are the same as in document 2: implementors’ test data.

3.2. Format

The first test set is shown twice, once in binary format, once in hexadecimal format. This is to explicitly show the relationship between the binary data and the hexadecimal representation. The remainder of the test sets are presented in hexadecimal format only. A hexadecimal number will be broken up in two rows of two 32-bit words. For example, the number ee36f7cf037d37d3692f7f0399e7949a will be written as

```
ee36f7cf 037d37d3
692f7f03 99e7949a.
```

3.3. Test Sets

4. CONFORMANCE TEST DATA FOR MILENAGE

4.1. Overview

The test data sets presented here are for the seven functions $f1, f1^*, f2, f3, f4, f5$ and $f5^*$. The first 6 test sets are the same as in document 2: implementors' test data.

4.2. Format

Each Test shows the various inputs to the algorithm. This is followed by the configuration field OP, the value $OP_C = OP \oplus E[OP]_K$ and finally by the function outputs.

The first test set is shown twice, once in binary format, once in hexadecimal format. This is to explicitly show the relationship between the binary data and the hexadecimal representation. The remainder of the test sets are presented in hexadecimal format only.
