Subject: Draft Liaison on Use of CAMEL in R00 for SIP and H323 services

From: CN Plenary

To: S1, S2

CN plenary have discussed the attached feasibility study “CAMEL Control of VoIP Services” (ie H323/SIP) (23.978 v2.1.0 – NP99533) developed by N2. The conclusion of the report is that use of CAMEL is feasible in conjunction with H323/SIP services. Other options are also possible and this report has not included a comparative analysis between all the options.

S1 and S2 are asked to consider this report together with any other options from a requirements and architecture perspective and to provide guidance on the architecture and approach to be used in R00. Early input to CN is required so that work on R00 can continue in a timely manner. This is also a topic that CN will discuss during their work on R00.
