## CHANGE REQUEST

⌘ **25.331 CR 1445** ⌘ rev **-** ⌘ Current version: **3.10.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

**Title:** ⌘ Layer 3 retransmission of SIGNALLING CONNECTION RELEASE INDICATION

**Source:** ⌘ TSG-RAN WG2

**Work item code:** ⌘ TEI

**Date:** ⌘ 13 May 2002

**Category:** ⌘ **F**

**Release:** ⌘ R99

Use one of the following categories:

Use one of the following releases:

**F** (correction)

**2** (GSM Phase 2)

**A** (corresponds to a correction in an earlier release)

**R96** (Release 1996)

**B** (addition of feature),

**R97** (Release 1997)

**C** (functional modification of feature)

**R98** (Release 1998)

**D** (editorial modification)

**R99** (Release 1999)

Detailed explanations of the above categories can be found in 3GPP TR 21.900.

**REL-4** (Release 4)

**REL-5** (Release 5)

**Reason for change:** ⌘ The SIGNALLING CONNECTION RELEASE INDICATION message was introduced to avoid a deadlock in case the NAS on the UE side decides to abort the signalling connection with a particular CN domain. If the message is lost as a result of a RLC re-establishment or inter-RAT change, the deadlock will not be avoided.

**Summary of change:** ⌘ It is proposed to handle the SIGNALLING CONNECTION RELEASE INDICATION message similarly to the INITIAL DIRECT TRANSFER message, i.e. it is proposed to have Layer 3 retransmission in case of RLC re-establishment or inter-RAT change

### Isolated Impact Change Analysis.

This change clarifies the SIGNALLING CONNECTION RELEASE INDICATION procedure.

It would not affect implementations behaving like indicated in the CR, it would affect implementations supporting the corrected functionality otherwise.

**Consequences if not approved:** ⌘ If NAS on the UE side decides to abort the signalling connection, the UE may not be able to release RRC/RR until it is powered down.

**Clauses affected:** ⌘ 8.1.14.2, 8.1.14.2a (new)

**Other specs affected:** ⌘  Other core specifications ⌘ 25.331 v4.4.0, CR 1446  
 25.331 v5.0.0, CR 1447

## 8.1.14 Signalling connection release indication procedure

**Figure 8.1.14-1: Signalling connection release indication procedure, normal case**

### 8.1.14.1 General

The signalling connection release indication procedure is used by the UE to indicate to the UTRAN that one of its signalling connections has been released. The procedure may in turn initiate the RRC connection release procedure.

### 8.1.14.2 Initiation

The UE shall, on receiving a request to release (abort) the signalling connection from upper layers for a specific CN domain:

- 1> if a signalling connection in the variable ESTABLISHED\_SIGNALLING\_CONNECTIONS for the specific CN domain identified with the IE "CN domain identity" exists:
  - 2> initiate the signalling connection release indication procedure.
- 1> otherwise:
  - 2> abort any ongoing establishment of signalling connection for that specific CN domain as specified in 8.1.3.5a.

Upon initiation of the signalling connection release indication procedure in CELL\_PCH or URA\_PCH state, the UE shall:

- 1> perform a cell update procedure, according to subclause 8.3.1, using the cause "uplink data transmission";
- 1> when the cell update procedure completed successfully:
  - 2> continue with the signalling connection release indication procedure as below.

The UE shall:

- 1> set the IE "CN Domain Identity" to the value indicated by the upper layers. The value of the IE indicates the CN domain whose associated signalling connection the upper layers are indicating to be released;
- 1> remove the signalling connection with the identity indicated by upper layers from the variable ESTABLISHED\_SIGNALLING\_CONNECTIONS;
- 1> transmit a SIGNALLING CONNECTION RELEASE INDICATION message on DCCH using AM RLC.

When the successful delivery of the SIGNALLING CONNECTION RELEASE INDICATION message has been confirmed by RLC ~~submitted to lower layers for transmission~~ the procedure ends.

### 8.1.14.2a RLC re-establishment or inter-RAT change

If a re-establishment of RLC on signalling radio bearer RB2 occurs before the successful delivery of the SIGNALLING CONNECTION RELEASE INDICATION message has been confirmed by RLC, the UE shall:

- 1> retransmit the SIGNALLING CONNECTION RELEASE INDICATION message on the uplink DCCH using AM RLC on signalling radio bearer RB2.

If an Inter-RAT handover from UTRAN procedure occurs before the successful delivery of the SIGNALLING CONNECTION RELEASE INDICATION message has been confirmed by RLC, the UE shall:

- 1> abort the signalling connection while in the new RAT.

### 8.1.14.3 Reception of SIGNALLING CONNECTION RELEASE INDICATION by the UTRAN

Upon reception of a SIGNALLING CONNECTION RELEASE INDICATION message, the UTRAN requests the release of the signalling connection from upper layers. Upper layers may then initiate the release of the signalling connection.

### 8.1.14 Signalling connection release indication procedure

**Figure 8.1.14-1: Signalling connection release indication procedure, normal case**

#### 8.1.14.1 General

The signalling connection release indication procedure is used by the UE to indicate to the UTRAN that one of its signalling connections has been released. The procedure may in turn initiate the RRC connection release procedure.

#### 8.1.14.2 Initiation

The UE shall, on receiving a request to release (abort) the signalling connection from upper layers for a specific CN domain:

- 1> if a signalling connection in the variable ESTABLISHED\_SIGNALLING\_CONNECTIONS for the specific CN domain identified with the IE "CN domain identity" exists:
  - 2> initiate the signalling connection release indication procedure.
- 1> otherwise:
  - 2> abort any ongoing establishment of signalling connection for that specific CN domain as specified in 8.1.3.5a.

Upon initiation of the signalling connection release indication procedure in CELL\_PCH or URA\_PCH state, the UE shall:

- 1> perform a cell update procedure, according to subclause 8.3.1, using the cause "uplink data transmission";
- 1> when the cell update procedure completed successfully:
  - 2> continue with the signalling connection release indication procedure as below.

The UE shall:

- 1> set the IE "CN Domain Identity" to the value indicated by the upper layers. The value of the IE indicates the CN domain whose associated signalling connection the upper layers are indicating to be released;
- 1> remove the signalling connection with the identity indicated by upper layers from the variable ESTABLISHED\_SIGNALLING\_CONNECTIONS;
- 1> transmit a SIGNALLING CONNECTION RELEASE INDICATION message on DCCH using AM RLC.

When the successful delivery of the SIGNALLING CONNECTION RELEASE INDICATION message has been confirmed by RLC ~~submitted to lower layers for transmission~~ the procedure ends.

### 8.1.14.2a RLC re-establishment or inter-RAT change

If a re-establishment of RLC on signalling radio bearer **RB2** occurs before the successful delivery of the SIGNALLING CONNECTION RELEASE INDICATION message has been confirmed by RLC, the UE shall:

- 1> retransmit the SIGNALLING CONNECTION RELEASE INDICATION message on the uplink DCCH using AM RLC on signalling radio bearer **RB2**.

If an Inter-RAT handover from UTRAN procedure occurs before the successful delivery of the SIGNALLING CONNECTION RELEASE INDICATION message has been confirmed by RLC, the UE shall:

- 1> abort the signalling connection while in the new RAT.

### 8.1.14.3 Reception of SIGNALLING CONNECTION RELEASE INDICATION by the UTRAN

Upon reception of a SIGNALLING CONNECTION RELEASE INDICATION message, the UTRAN requests the release of the signalling connection from upper layers. Upper layers may then initiate the release of the signalling connection.

[...]

## CHANGE REQUEST

⌘ **25.331 CR 1448** ⌘ rev **-** ⌘ Current version: **3.10.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

Proposed change affects: ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

**Title:** ⌘ Alignment of tabular and ASN.1 for UTRAN GPS timing of cell frames resolution

**Source:** ⌘ TSG-RAN WG2

**Work item code:** ⌘ TEI

**Date:** ⌘ 13 May 2002

**Category:** ⌘ **F**

**Release:** ⌘ R99

Use one of the following categories:

Use one of the following releases:

**F** (correction)

**2** (GSM Phase 2)

**A** (corresponds to a correction in an earlier release)

**R96** (Release 1996)

**B** (addition of feature),

**R97** (Release 1997)

**C** (functional modification of feature)

**R98** (Release 1998)

**D** (editorial modification)

**R99** (Release 1999)

Detailed explanations of the above categories can be found in 3GPP [TR 21.900](#).

**REL-4** (Release 4)

**REL-5** (Release 5)

**Reason for change:** ⌘ 1. In order to unambiguously span an entire week, the "UTRAN GPS timing of cell frames" component of IE "UE positioning GPS reference time" (10.3.7.96) must have an integer range of (0..232243199999) and a resolution of 1 chip.

Note that:

$(2322432000000 \text{ chips} / 3840000 \text{ chips per sec}) = 604800 \text{ sec} = 1 \text{ week}$

This change enables the meaning of the "UTRAN GPS timing of cell frames" component to be consistently interpreted across the following portions of the specification:

- tabular description of 10.3.7.88
- tabular description of 10.3.7.96
- ASN.1 description of "UTRAN-GPSReferenceTime"

2. [From Tdoc 1261]

During RAN #15, from Tdoc RP-020074, CR-1342-R3 was approved for R99, and CR-1343 was approved for REL-4.

One of the purposes of these CRs was to remove the procedural significance of the IE "UE positioning GPS reference cell info" (10.3.7.95a). These CRs removed statements explaining how this IE would be used to help direct the UE in making "UE GPS timing of cell frames" measurements.

Since the significance (or usefulness) of this IE is now removed from the specification, it makes sense to remove the remaining associated references to this IE.

3. [From Tdoc 1155]

During RAN #14, from Tdoc RP-010941, CR-1185-R4 was approved for R99, and CR-1186 was approved for REL-4. These CRs corrected the tabular description of the type and reference column for the "Whole GPS Chips" component of the IE "UE positioning GPS measured results" (10.3.7.93). The specified range was

adjusted from (0..1023) to the correct range of (0..1022). Unfortunately, the range of the corresponding ASN.1 element was not adjusted at that time. This CR simply adjusts the “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 information element to indicate the correct range of (0..1022). Note that the representation of this component remains to be a 10-bit integer.

**Summary of change:** ☼

1. The semantics description for the “UTRAN GPS timing of cell frames” component of IE “UE positioning GPS reference time” (10.3.7.96) is changed to indicate 1 chip resolution instead of 1/16 chip resolution.

2. [From Tdoc 1261]

All references to the unused IE “UE positioning GPS reference cell info” (10.3.7.95a) are removed.

3. [From Tdoc 1155]

The “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 information element is adjusted to indicate the correct range of (0..1022).

**Isolated Impact Change Analysis.**

1. This change clarifies the resolution of the “UTRAN GPS timing of cell frames” component that may be used in providing UTRAN-GPS timing assistance to the UE.

2. [From Tdoc 1261]

This change removes portions of the specification associated with the unused (and purposeless) IE “UE positioning GPS reference cell info” (10.3.7.95a).

3. [From Tdoc 1155]

This change corrects the range of the “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 element.

It would not affect implementations behaving like indicated in the CR, it would affect implementations supporting the corrected functionality otherwise.

**Consequences if not approved:**

☼ 1. The tabular description of the “UTRAN GPS timing of cell frames” component of IE “UE positioning GPS reference time” (10.3.7.96) will conflict with the description of the same component of IE “UE positioning GPS acquisition assistance” (10.3.7.88) and the definition of the associated ASN.1 element “UTRAN-GPSReferenceTime”. Consequently, it will be unclear how the UE is to interpret the intended resolution of this parameter. If a UE incorrectly interprets the resolution of this parameter, the search for GPS satellites may fail and the time-stamping value assigned to GPS measurements may cause gross errors in the resulting position computation.

2. [From Tdoc 1261]

Useless references and ASN.1 code elements associated with this IE “UE positioning GPS reference cell info” will remain in the specification, possibly causing confusion with respect to the meaning of the term “reference cell”.

3. [From Tdoc 1155]

Since GPS codes are each composed of 1023 chips, if this range is not corrected to indicate (0..1022), then it will be unclear how the UTRAN is to interpret the value “wholeGPS-Chips”=1023. Two interpretations are possible: a) “1023” wraps around to equal “0”; or, b) “1023” extends 1023 chips beyond “0”. If the UE and UTRAN do not share the same common interpretation of this value, then it is possible that such a GPS measurement could cause a large error in the final position computation.

**Clauses affected:**

☼ 8.6.7.19.6, 10.3.7.90, 10.3.7.95a, 10.3.7.96, 11.3, 13.4.28a

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at: [http://www.3gpp.org/3G\\_Specs/CRs.htm](http://www.3gpp.org/3G_Specs/CRs.htm). Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

## CHANGE REQUEST

⌘ **25.331 CR 1449** ⌘ rev **-** ⌘ Current version: **4.4.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

**Title:** ⌘ Alignment of tabular and ASN.1 for UTRAN GPS timing of cell frames resolution

**Source:** ⌘ TSG-RAN WG2

**Work item code:** ⌘ TEI

**Date:** ⌘ 13 May 2002

**Category:** ⌘ **A**

**Release:** ⌘ REL-4

Use one of the following categories:

Use one of the following releases:

**F** (correction)

**2** (GSM Phase 2)

**A** (corresponds to a correction in an earlier release)

**R96** (Release 1996)

**B** (addition of feature),

**R97** (Release 1997)

**C** (functional modification of feature)

**R98** (Release 1998)

**D** (editorial modification)

**R99** (Release 1999)

Detailed explanations of the above categories can be found in 3GPP [TR 21.900](#).

**REL-4** (Release 4)

**REL-5** (Release 5)

**Reason for change:** ⌘ 1. In order to unambiguously span an entire week, the "UTRAN GPS timing of cell frames" component of IE "UE positioning GPS reference time" (10.3.7.96) must have an integer range of (0..232243199999) and a resolution of 1 chip.

Note that:

$(2322432000000 \text{ chips} / 3840000 \text{ chips per sec}) = 604800 \text{ sec} = 1 \text{ week}$

This change enables the meaning of the "UTRAN GPS timing of cell frames" component to be consistently interpreted across the following portions of the specification:

- tabular description of 10.3.7.88
- tabular description of 10.3.7.96
- ASN.1 description of "UTRAN-GPSReferenceTime"

2. [From Tdoc 1261]

During RAN #15, from Tdoc RP-020074, CR-1342-R3 was approved for R99, and CR-1343 was approved for REL-4.

One of the purposes of these CRs was to remove the procedural significance of the IE "UE positioning GPS reference cell info" (10.3.7.95a). These CRs removed statements explaining how this IE would be used to help direct the UE in making "UE GPS timing of cell frames" measurements.

Since the significance (or usefulness) of this IE is now removed from the specification, it makes sense to remove the remaining associated references to this IE.

3. [From Tdoc 1155]

During RAN #14, from Tdoc RP-010941, CR-1185-R4 was approved for R99, and CR-1186 was approved for REL-4. These CRs corrected the tabular description of the type and reference column for the "Whole GPS Chips" component of the IE "UE positioning GPS measured results" (10.3.7.93). The specified range was

adjusted from (0..1023) to the correct range of (0..1022). Unfortunately, the range of the corresponding ASN.1 element was not adjusted at that time. This CR simply adjusts the “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 information element to indicate the correct range of (0..1022). Note that the representation of this component remains to be a 10-bit integer.

**Summary of change:** ☼

1. The semantics description for the “UTRAN GPS timing of cell frames” component of IE “UE positioning GPS reference time” (10.3.7.96) is changed to indicate 1 chip resolution instead of 1/16 chip resolution.

2. [From Tdoc 1261]

All references to the unused IE “UE positioning GPS reference cell info” (10.3.7.95a) are removed.

3. [From Tdoc 1155]

The “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 information element is adjusted to indicate the correct range of (0..1022).

**Isolated Impact Change Analysis.**

1. This change clarifies the resolution of the “UTRAN GPS timing of cell frames” component that may be used in providing UTRAN-GPS timing assistance to the UE.

2. [From Tdoc 1261]

This change removes portions of the specification associated with the unused (and purposeless) IE “UE positioning GPS reference cell info” (10.3.7.95a).

3. [From Tdoc 1155]

This change corrects the range of the “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 element.

It would not affect implementations behaving like indicated in the CR, it would affect implementations supporting the corrected functionality otherwise.

**Consequences if not approved:**

☼ 1. The tabular description of the “UTRAN GPS timing of cell frames” component of IE “UE positioning GPS reference time” (10.3.7.96) will conflict with the description of the same component of IE “UE positioning GPS acquisition assistance” (10.3.7.88) and the definition of the associated ASN.1 element “UTRAN-GPSReferenceTime”. Consequently, it will be unclear how the UE is to interpret the intended resolution of this parameter. If a UE incorrectly interprets the resolution of this parameter, the search for GPS satellites may fail and the time-stamping value assigned to GPS measurements may cause gross errors in the resulting position computation.

2. [From Tdoc 1261]

Useless references and ASN.1 code elements associated with this IE “UE positioning GPS reference cell info” will remain in the specification, possibly causing confusion with respect to the meaning of the term “reference cell”.

3. [From Tdoc 1155]

Since GPS codes are each composed of 1023 chips, if this range is not corrected to indicate (0..1022), then it will be unclear how the UTRAN is to interpret the value “wholeGPS-Chips”=1023. Two interpretations are possible: a) “1023” wraps around to equal “0”; or, b) “1023” extends 1023 chips beyond “0”. If the UE and UTRAN do not share the same common interpretation of this value, then it is possible that such a GPS measurement could cause a large error in the final position computation.

**Clauses affected:**

☼ 8.6.7.19.6, 10.3.7.90, 10.3.7.95a, 10.3.7.96, 11.3, 13.4.28a

## CHANGE REQUEST

⌘ **25.331 CR 1450** ⌘ rev **-** ⌘ Current version: **5.0.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

Proposed change affects: ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

**Title:** ⌘ Alignment of tabular and ASN.1 for UTRAN GPS timing of cell frames resolution

**Source:** ⌘ TSG-RAN WG2

**Work item code:** ⌘ TEI

**Date:** ⌘ 13 May 2002

**Category:** ⌘ **A**

**Release:** ⌘ REL-5

Use one of the following categories:

Use one of the following releases:

**F** (correction)

**2** (GSM Phase 2)

**A** (corresponds to a correction in an earlier release)

**R96** (Release 1996)

**B** (addition of feature),

**R97** (Release 1997)

**C** (functional modification of feature)

**R98** (Release 1998)

**D** (editorial modification)

**R99** (Release 1999)

Detailed explanations of the above categories can be found in 3GPP [TR 21.900](#).

**REL-4** (Release 4)

**REL-5** (Release 5)

**Reason for change:** ⌘ 1. In order to unambiguously span an entire week, the "UTRAN GPS timing of cell frames" component of IE "UE positioning GPS reference time" (10.3.7.96) must have an integer range of (0..232243199999) and a resolution of 1 chip.

Note that:

$(2322432000000 \text{ chips} / 3840000 \text{ chips per sec}) = 604800 \text{ sec} = 1 \text{ week}$

This change enables the meaning of the "UTRAN GPS timing of cell frames" component to be consistently interpreted across the following portions of the specification:

- tabular description of 10.3.7.88
- tabular description of 10.3.7.96
- ASN.1 description of "UTRAN-GPSReferenceTime"

2. [From Tdoc 1261]

During RAN #15, from Tdoc RP-020074, CR-1342-R3 was approved for R99, and CR-1343 was approved for REL-4.

One of the purposes of these CRs was to remove the procedural significance of the IE "UE positioning GPS reference cell info" (10.3.7.95a). These CRs removed statements explaining how this IE would be used to help direct the UE in making "UE GPS timing of cell frames" measurements.

Since the significance (or usefulness) of this IE is now removed from the specification, it makes sense to remove the remaining associated references to this IE.

3. [From Tdoc 1155]

During RAN #14, from Tdoc RP-010941, CR-1185-R4 was approved for R99, and CR-1186 was approved for REL-4. These CRs corrected the tabular description of the type and reference column for the "Whole GPS Chips" component of the IE "UE positioning GPS measured results" (10.3.7.93). The specified range was

adjusted from (0..1023) to the correct range of (0..1022). Unfortunately, the range of the corresponding ASN.1 element was not adjusted at that time. This CR simply adjusts the “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 information element to indicate the correct range of (0..1022). Note that the representation of this component remains to be a 10-bit integer.

**Summary of change:** ☼

1. The semantics description for the “UTRAN GPS timing of cell frames” component of IE “UE positioning GPS reference time” (10.3.7.96) is changed to indicate 1 chip resolution instead of 1/16 chip resolution.

2. [From Tdoc 1261]

All references to the unused IE “UE positioning GPS reference cell info” (10.3.7.95a) are removed.

3. [From Tdoc 1155]

The “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 information element is adjusted to indicate the correct range of (0..1022).

**Isolated Impact Change Analysis.**

1. This change clarifies the resolution of the “UTRAN GPS timing of cell frames” component that may be used in providing UTRAN-GPS timing assistance to the UE.

2. [From Tdoc 1261]

This change removes portions of the specification associated with the unused (and purposeless) IE “UE positioning GPS reference cell info” (10.3.7.95a).

3. [From Tdoc 1155]

This change corrects the range of the “wholeGPS-Chips” component of the “GPS-MeasurementParam” ASN.1 element.

It would not affect implementations behaving like indicated in the CR, it would affect implementations supporting the corrected functionality otherwise.

**Consequences if not approved:**

☼ 1. The tabular description of the “UTRAN GPS timing of cell frames” component of IE “UE positioning GPS reference time” (10.3.7.96) will conflict with the description of the same component of IE “UE positioning GPS acquisition assistance” (10.3.7.88) and the definition of the associated ASN.1 element “UTRAN-GPSReferenceTime”. Consequently, it will be unclear how the UE is to interpret the intended resolution of this parameter. If a UE incorrectly interprets the resolution of this parameter, the search for GPS satellites may fail and the time-stamping value assigned to GPS measurements may cause gross errors in the resulting position computation.

2. [From Tdoc 1261]

Useless references and ASN.1 code elements associated with this IE “UE positioning GPS reference cell info” will remain in the specification, possibly causing confusion with respect to the meaning of the term “reference cell”.

3. [From Tdoc 1155]

Since GPS codes are each composed of 1023 chips, if this range is not corrected to indicate (0..1022), then it will be unclear how the UTRAN is to interpret the value “wholeGPS-Chips”=1023. Two interpretations are possible: a) “1023” wraps around to equal “0”; or, b) “1023” extends 1023 chips beyond “0”. If the UE and UTRAN do not share the same common interpretation of this value, then it is possible that such a GPS measurement could cause a large error in the final position computation.

**Clauses affected:**

☼ 8.6.7.19.6, 10.3.7.90, 10.3.7.95a, 10.3.7.96, 11.3, 13.4.28a

<b>Other specs</b>	⌘	<input type="checkbox"/>	Other core specifications	⌘	25.331 v3.10.0, CR 1448 25.331 v4.4.0, CR 1449
<b>affected:</b>		<input type="checkbox"/>	Test specifications		
		<input type="checkbox"/>	O&M Specifications		
<b>Other comments:</b>	⌘	<input type="text"/>			

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at: [http://www.3gpp.org/3G\\_Specs/CRs.htm](http://www.3gpp.org/3G_Specs/CRs.htm). Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

## CHANGE REQUEST

⌘ **25.331 CR 1451** ⌘ rev **-** ⌘ Current version: **3.10.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

<b>Title:</b>	⌘ Correction to Default Radio Configuration Timers.		
<b>Source:</b>	⌘ TSG-RAN WG2		
<b>Work item code:</b>	⌘ TEI	<b>Date:</b>	⌘ 07.05.2002
<b>Category:</b>	⌘ <b>F</b>	<b>Release:</b>	⌘ R99
	<i>Use <u>one</u> of the following categories:</i> <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP TR 21.900.		<i>Use <u>one</u> of the following releases:</i> <b>2</b> (GSM Phase 2) <b>R96</b> (Release 1996) <b>R97</b> (Release 1997) <b>R98</b> (Release 1998) <b>R99</b> (Release 1999) <b>REL-4</b> (Release 4) <b>REL-5</b> (Release 5)

<b>Reason for change:</b>	⌘ Clause 13.7 defines several default radio configurations which use 3.4 kbps signalling radio bearers. In all of these configurations the parameter timerStatusPeriodic has value 100ms for RB2 and RB3 (RLC AM), and the TTI associated with the signalling radio bearer transport channel has value 40ms.  Using this configuration, 2 STATUS PDUs will be transmitted every 100ms on a transport channel which has capacity for 25 RLC PDUs, and this could result in 80% of the available transport channel capacity being used for this overhead. This is an inefficient use of the available bandwidth.  Also, using this same configuration and then mapping a third AM signalling radio bearer onto the same transport channel could result in 120% transport channel capacity overhead. Furthermore, the inclusion of timerPollPeriodic polling, which also has value 100ms, with either of these previous examples will increase the transport channel capacity overhead even further.  It is proposed that the values of both timerStatusPeriodic and timerPollPeriodic are increased from 100ms to 300ms in all default radio configurations which use 3.4 kbps signalling radio bearers in clause 13.7 in order to significantly reduce the transport channel capacity overhead for these AM signalling radio bearers.
<b>Summary of change:</b>	⌘ The values of both timerStatusPeriodic and timerPollPeriodic have been increased from 100ms to 300ms in all default radio configurations which use 3.4 kbps signalling radio bearers in clause 13.7  <b>Impact Analysis:</b> This is an isolated impact correction to the value for timerStatusPeriodic and timerPollPeriodic in the default radio configurations. No interworking problems are anticipated:

UE implements/NW doesn't – UE will timeout slightly less frequently than the NW expects.

NW implements/UE doesn't – UE will timeout slightly more frequently than the NW expects.

In both cases the NW can reconfigure the UE if it wishes to change the timer values.

**Consequences if not approved:** ⌘ The default radio bearer configurations which use 3.4 kbps signalling radio bearers may not work.

**Clauses affected:** ⌘ 13.7

**Other specs affected:**

			25.331 v5.0.0, CR 1453
	Test specifications		
	O&M Specifications		

**Other comments:** ⌘

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at: [http://www.3gpp.org/3G\\_Specs/CRs.htm](http://www.3gpp.org/3G_Specs/CRs.htm). Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/>. For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

## 13.7 Parameter values for default radio configurations

The UE shall support the use of the default radio configurations that are specified in the following.

NOTE 1: These configurations are based on [41] and cover a number of RAB and signalling connection configurations.

In the table that is used to specify the parameter values for these default configurations, the following principles are used:

- Optional IEs that are not used are omitted;
- In case no parameter value is specified in a column, this means the value given the previous (left side) column applies.

NOTE 2: If needed, signalling radio bearer RB4 is established after the completion of handover.

NOTE 3: For each default configuration, the value of both FDD and TDD parameters are specified. All parameters apply to both FDD and TDD modes, unless explicitly stated otherwise. It should be noted that in this respect default configurations differ from pre-defined configurations, which only include parameter values for one mode.

NOTE 4: The transport format sizes, indicated in the following table, concern the RLC PDU size, since all configurations concern dedicated channels. The transport block sizes indicated in TS 34.108 are different since these include the size of the MAC header.

## CHANGE REQUEST

⌘ **25.331 CR 1452** ⌘ rev **-** ⌘ Current version: **4.4.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

<b>Title:</b>	⌘ Correction to Default Radio Configuration Timers.		
<b>Source:</b>	⌘ TSG-RAN WG2		
<b>Work item code:</b>	⌘ TEI	<b>Date:</b>	⌘ 07.05.2002
<b>Category:</b>	⌘ <b>A</b>	<b>Release:</b>	⌘ REL-4
	<i>Use <u>one</u> of the following categories:</i> <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP TR 21.900.		<i>Use <u>one</u> of the following releases:</i> <b>2</b> (GSM Phase 2) <b>R96</b> (Release 1996) <b>R97</b> (Release 1997) <b>R98</b> (Release 1998) <b>R99</b> (Release 1999) <b>REL-4</b> (Release 4) <b>REL-5</b> (Release 5)

<b>Reason for change:</b>	⌘ Clause 13.7 defines several default radio configurations which use 3.4 kbps signalling radio bearers. In all of these configurations the parameter timerStatusPeriodic has value 100ms for RB2 and RB3 (RLC AM), and the TTI associated with the signalling radio bearer transport channel has value 40ms.
	Using this configuration, 2 STATUS PDUs will be transmitted every 100ms on a transport channel which has capacity for 25 RLC PDUs, and this could result in 80% of the available transport channel capacity being used for this overhead. This is an inefficient use of the available bandwidth.
	Also, using this same configuration and then mapping a third AM signalling radio bearer onto the same transport channel could result in 120% transport channel capacity overhead. Furthermore, the inclusion of timerPollPeriodic polling, which also has value 100ms, with either of these previous examples will increase the transport channel capacity overhead even further.
	It is proposed that the values of both timerStatusPeriodic and timerPollPeriodic are increased from 100ms to 300ms in all default radio configurations which use 3.4 kbps signalling radio bearers in clause 13.7 in order to significantly reduce the transport channel capacity overhead for these AM signalling radio bearers.
<b>Summary of change:</b>	⌘ The values of both timerStatusPeriodic and timerPollPeriodic have been increased from 100ms to 300ms in all default radio configurations which use 3.4 kbps signalling radio bearers in clause 13.7
<b>Consequences if not approved:</b>	⌘ The default radio bearer configurations which use 3.4 kbps signalling radio bearers may not work.

**Clauses affected:** ⌘ 13.7

<b>Other specs</b>	⌘	<input type="checkbox"/>	Other core specifications	⌘	25.331 v3.10.0, CR 1451
<b>affected:</b>		<input type="checkbox"/>	Test specifications		25.331 v5.0.0, CR 1453
		<input type="checkbox"/>	O&M Specifications		
<b>Other comments:</b>	⌘	<input type="text"/>			

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at: [http://www.3gpp.org/3G\\_Specs/CRs.htm](http://www.3gpp.org/3G_Specs/CRs.htm). Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

## 13.7 Parameter values for default radio configurations

The UE shall support the use of the default radio configurations that are specified in the following.

NOTE 1: These configurations are based on [41] and cover a number of RAB and signalling connection configurations.

In the table that is used to specify the parameter values for these default configurations, the following principles are used:

- Optional IEs that are not used are omitted;
- In case no parameter value is specified in a column, this means the value given the previous (left side) column applies.

NOTE 2: If needed, signalling radio bearer RB4 is established after the completion of handover.

NOTE 3: For each default configuration, the value of FDD, 3.84 Mcps TDD and 1.28 Mcps TDD parameters are specified. All parameters apply to FDD, 3.84 Mcps TDD and 1.28 Mcps TDD modes, unless explicitly stated otherwise. It should be noted that in this respect default configurations differ from pre-defined configurations, which only include parameter values for one mode.

NOTE 4: The transport format sizes, indicated in the following table, concern the RLC PDU size, since all configurations concern dedicated channels. The transport block sizes indicated in TS 34.108 are different since these include the size of the MAC header.

## CHANGE REQUEST

⌘ **25.331 CR 1453** ⌘ rev **-** ⌘ Current version: **5.0.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

<b>Title:</b>	⌘ Correction to Default Radio Configuration Timers.		
<b>Source:</b>	⌘ TSG-RAN WG2		
<b>Work item code:</b>	⌘ TEI	<b>Date:</b>	⌘ 07.05.2002
<b>Category:</b>	⌘ <b>A</b>	<b>Release:</b>	⌘ REL-5
	<i>Use <u>one</u> of the following categories:</i> <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP TR 21.900.		<i>Use <u>one</u> of the following releases:</i> <b>2</b> (GSM Phase 2) <b>R96</b> (Release 1996) <b>R97</b> (Release 1997) <b>R98</b> (Release 1998) <b>R99</b> (Release 1999) <b>REL-4</b> (Release 4) <b>REL-5</b> (Release 5)

<b>Reason for change:</b>	⌘ Clause 13.7 defines several default radio configurations which use 3.4 kbps signalling radio bearers. In all of these configurations the parameter timerStatusPeriodic has value 100ms for RB2 and RB3 (RLC AM), and the TTI associated with the signalling radio bearer transport channel has value 40ms.
	Using this configuration, 2 STATUS PDUs will be transmitted every 100ms on a transport channel which has capacity for 25 RLC PDUs, and this could result in 80% of the available transport channel capacity being used for this overhead. This is an inefficient use of the available bandwidth.
	Also, using this same configuration and then mapping a third AM signalling radio bearer onto the same transport channel could result in 120% transport channel capacity overhead. Furthermore, the inclusion of timerPollPeriodic polling, which also has value 100ms, with either of these previous examples will increase the transport channel capacity overhead even further.
	It is proposed that the values of both timerStatusPeriodic and timerPollPeriodic are increased from 100ms to 300ms in all default radio configurations which use 3.4 kbps signalling radio bearers in clause 13.7 in order to significantly reduce the transport channel capacity overhead for these AM signalling radio bearers.
<b>Summary of change:</b>	⌘ The values of both timerStatusPeriodic and timerPollPeriodic have been increased from 100ms to 300ms in all default radio configurations which use 3.4 kbps signalling radio bearers in clause 13.7
<b>Consequences if not approved:</b>	⌘ The default radio bearer configurations which use 3.4 kbps signalling radio bearers may not work.

**Clauses affected:** ⌘ 13.7

<b>affected:</b>		<input type="checkbox"/>	Test specifications		25.331 v4.4.0, CR 1452
		<input type="checkbox"/>	O&M Specifications		
<b>Other comments:</b>	⌘	<input type="text"/>			

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at: [http://www.3gpp.org/3G\\_Specs/CRs.htm](http://www.3gpp.org/3G_Specs/CRs.htm). Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

## 13.7 Parameter values for default radio configurations

The UE shall support the use of the default radio configurations that are specified in the following.

NOTE 1: These configurations are based on [41] and cover a number of RAB and signalling connection configurations.

In the table that is used to specify the parameter values for these default configurations, the following principles are used:

- Optional IEs that are not used are omitted;
- In case no parameter value is specified in a column, this means the value given the previous (left side) column applies.

NOTE 2: If needed, signalling radio bearer RB4 is established after the completion of handover.

NOTE 3: For each default configuration, the value of FDD, 3.84 Mcps TDD and 1.28 Mcps TDD parameters are specified. All parameters apply to FDD, 3.84 Mcps TDD and 1.28 Mcps TDD modes, unless explicitly stated otherwise. It should be noted that in this respect default configurations differ from pre-defined configurations, which only include parameter values for one mode.

NOTE 4: The transport format sizes, indicated in the following table, concern the RLC PDU size, since all configurations concern dedicated channels. The transport block sizes indicated in TS 34.108 are different since these include the size of the MAC header.

## CHANGE REQUEST

⌘ **25.331 CR 1454** ⌘ rev **-** ⌘ Current version: **3.10.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

<b>Title:</b>	⌘ Clarification to number of L3 filters		
<b>Source:</b>	⌘ TSG-RAN WG2		
<b>Work item code:</b>	⌘ TEI	<b>Date:</b>	⌘ 17.May 2002
<b>Category:</b>	⌘ <b>F</b>	<b>Release:</b>	⌘ R99
	<i>Use <u>one</u> of the following categories:</i> <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP <a href="#">TR 21.900</a> .		<i>Use <u>one</u> of the following releases:</i> <b>2</b> (GSM Phase 2) <b>R96</b> (Release 1996) <b>R97</b> (Release 1997) <b>R98</b> (Release 1998) <b>R99</b> (Release 1999) <b>REL-4</b> (Release 4) <b>REL-5</b> (Release 5)

**Reason for change:** ⌘ A CR was approved during RAN2#29 (CR1361) that allows the UE to reject a MEASUREMENT CONTROL message that would require more than 2 L3 filters per measurement type. Objective was to define an upper limit for the UE memory requirements.

Currently the specification states the following:

*"The UE shall support 2 different layer 3 filters per measurement type as indicated in the RRC signalling"*

This definition is ambiguous because the term "measurement type" can be interpreted differently.

One possible interpretation would be that it refers to the IE "measurement type" in the MEASUREMENT CONTROL message. However, a message with IE "measurement type" set to "inter-frequency measurement" could still be used to configure a measurement on intra-frequencies (event 2F), or it could configure a measurement on inter-frequency neighbours which use intra-frequency evaluation criteria (events 1x) to maintain the virtual active set. Other combinations are possible as well. This a interpretation would not limit the memory consumption for storing L3 filtered measurement results, there could still be any number of filters attached to intra- and inter-frequency cells.

The other interpretation is that it refers to the type of measurement results that are filtered and to the definitions in section 8.4.0 which distinguishes more precisely between intra-frequency measurement, inter-frequency measurements and inter-RAT measurements. This interpretation makes more sense since it's the measurement result that is filtered.

It is assumed that the second interpretation reflects the original intention of the agreed CR1361 and the text is clarified accordingly.

**Backward compatibility analysis:**

If the UE does not implement the change would have to support a large number of L3 filters per measurement result. The UE might also reject valid

MEASUREMENT CONTROL messages from the network, depending on the interpretation of the specification.

If the network does not implement the change then it might configure too many filters, the MEASUREMENT CONTROL message might be rejected by a UE.

**Summary of change:** ⌘ Rewording in section 8.6.7.2 according to the second interpretation above

**Consequences if not approved:** ⌘ It remains unclear when a UE is allowed to reject a MEASUREMENT CONTROL message

**Clauses affected:** ⌘ 8.6.7.2

**Other specs affected:** ⌘  Other core specifications ⌘ 25.331 v4.4.0, CR 1455  
25.331 v5.0.0, CR 1456

Test specifications  
 O&M Specifications

**Other comments:** ⌘

### 8.6.7.2 Filter coefficient

If the IE "Filter coefficient" is received the UE shall apply filtering of the measurements for that measurement quantity according to the formula below. This filtering shall be performed by the UE before UE event evaluation. The UE shall also filter the measurements reported in the IE "Measured results". The filtering shall not be performed for the measurements reported in the IE "Measured results on RACH" and for cell-reselection in connected or idle mode.

The filtering shall be performed according to the following formula.

$$F_n = (1 - a) \cdot F_{n-1} + a \cdot M_n$$

The variables in the formula are defined as follows:

$F_n$  is the updated filtered measurement result

$F_{n-1}$  is the old filtered measurement result

$M_n$  is the latest received measurement result from physical layer measurements, the unit used for  $M_n$  is the same unit as the reported unit in the MEASUREMENT REPORT message or the unit used in the event evaluation.

$a = 1/2^{(k/2)}$ , where  $k$  is the parameter received in the IE "Filter coefficient".

NOTE: if  $k$  is set to 0 that will mean no layer 3 filtering.

In order to initialise the averaging filter,  $F_0$  is set to  $M_1$  when the first measurement result from the physical layer measurement is received.

The physical layer measurement results are sampled once every measurement period. The measurement period and the accuracy for a certain measurement is defined in [19] and [20].

The UE shall support 2 different layer 3 filters per measurement type as indicated in the RRC signalling defined in section 8.4.0 (i.e. the UE shall be capable to apply at least 2 different L3 filters to intra-frequency measurement results, at least 2 different L3 filters to inter-frequency measurement results etc). If a MEASUREMENT CONTROL message is received that would require the UE to configure more than 2 different layer 3 filters, the UE may:

1> set the variable CONFIGURATION\_INCOMPLETE to TRUE.

## 8.4.0 Measurement related definitions

[...]

The different types of measurements are:

- **Intra-frequency measurements:** measurements on downlink physical channels at the same frequency as the active set. A measurement object corresponds to one cell. Detailed description is found in subclause 14.1.
- **Inter-frequency measurements:** measurements on downlink physical channels at frequencies that differ from the frequency of the active set. A measurement object corresponds to one cell. Detailed description is found in subclause 14.2.
- **Inter-RAT measurements:** measurements on downlink physical channels belonging to another radio access technology than UTRAN, e.g. GSM. A measurement object corresponds to one cell. Detailed description is found in subclause 14.3.

This definition is ambiguous because the term "measurement type" can be interpreted differently.

One possible interpretation would be that it refers to the IE "measurement type" in the MEASUREMENT CONTROL message. However, a message with IE "measurement type" set to "inter-frequency measurement" could still be used to configure a measurement on intra-frequencies (event 2F), or it could configure a measurement on inter-frequency neighbours which use intra-frequency evaluation criteria (events 1x) to maintain the virtual active set. Other combinations are possible as well. This a interpretation would not limit the memory consumption for storing L3 filtered measurement results, there could still be any number of filters attached to intra- and inter-frequency cells.

The other interpretation is that it refers to the type of measurement results that are filtered and to the definitions in section 8.4.0 which distinguishes more precisely between intra-frequency measurement, inter-frequency measurements and inter-RAT measurements. This interpretation makes more sense since it's the measurement result that is filtered.

It is assumed that the second interpretation reflects the original intention of the agreed CR1361 and the text is clarified accordingly.

**Backward compatibility analysis:**

If the UE does not implement the change would have to support a large number of L3 filters per measurement result. The UE might also reject valid

	<p>MEASUREMENT CONTROL messages from the network, depending on the interpretation of the specification.</p> <p>If the network does not implement the change then it might configure too many filters, the MEASUREMENT CONTROL message might be rejected by a UE.</p>													
<b>Summary of change:</b>	⌘	Rewording in section 8.6.7.2 according to the second interpretation above												
<b>Consequences if not approved:</b>	⌘	It remains unclear when a UE is allowed to reject a MEASUREMENT CONTROL message

<b>Other comments:</b>	⌘													

### 8.6.7.2 Filter coefficient

If the IE "Filter coefficient" is received the UE shall apply filtering of the measurements for that measurement quantity according to the formula below. This filtering shall be performed by the UE before UE event evaluation. The UE shall also filter the measurements reported in the IE "Measured results". The filtering shall not be performed for the measurements reported in the IE "Measured results on RACH" and for cell-reselection in connected or idle mode.

The filtering shall be performed according to the following formula.

$$F_n = (1 - a) \cdot F_{n-1} + a \cdot M_n$$

The variables in the formula are defined as follows:

$F_n$  is the updated filtered measurement result

$F_{n-1}$  is the old filtered measurement result

$M_n$  is the latest received measurement result from physical layer measurements, the unit used for  $M_n$  is the same unit as the reported unit in the MEASUREMENT REPORT message or the unit used in the event evaluation.

$a = 1/2^{(k/2)}$ , where  $k$  is the parameter received in the IE "Filter coefficient".

NOTE: if  $k$  is set to 0 that will mean no layer 3 filtering.

In order to initialise the averaging filter,  $F_0$  is set to  $M_1$  when the first measurement result from the physical layer measurement is received.

The physical layer measurement results are sampled once every measurement period. The measurement period and the accuracy for a certain measurement is defined in [19] and [20].

The UE shall support 2 different layer 3 filters per measurement type as indicated in the RRC signalling defined in section 8.4.0 (i.e. the UE shall be capable to apply at least 2 different L3 filters to intra-frequency measurement results, at least 2 different L3 filters to inter-frequency measurement results etc). If a MEASUREMENT CONTROL message is received that would require the UE to configure more than 2 different layer 3 filters, the UE may:

1> set the variable CONFIGURATION\_INCOMPLETE to TRUE.

## 8.4.0 Measurement related definitions

[...]

The different types of measurements are:

- **Intra-frequency measurements:** measurements on downlink physical channels at the same frequency as the active set. A measurement object corresponds to one cell. Detailed description is found in subclause 14.1.
- **Inter-frequency measurements:** measurements on downlink physical channels at frequencies that differ from the frequency of the active set. A measurement object corresponds to one cell. Detailed description is found in subclause 14.2.
- **Inter-RAT measurements:** measurements on downlink physical channels belonging to another radio access technology than UTRAN, e.g. GSM. A measurement object corresponds to one cell. Detailed description is found in subclause 14.3.

## CHANGE REQUEST

⌘ **25.331 CR 1457** ⌘ rev **r1** ⌘ Current version: **3.10.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

<b>Title:</b>	⌘ Correction to 3G to 2G Inter-RAT handover for multi-domain RABs		
<b>Source:</b>	⌘ TSG-RAN WG2		
<b>Work item code:</b>	⌘ TEI	<b>Date:</b>	⌘ 13 <sup>th</sup> - May 2002
<b>Category:</b>	⌘ <b>F</b>	<b>Release:</b>	⌘ R99
	<i>Use <u>one</u> of the following categories:</i> <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP TR 21.900.		<i>Use <u>one</u> of the following releases:</i> <b>2</b> (GSM Phase 2) <b>R96</b> (Release 1996) <b>R97</b> (Release 1997) <b>R98</b> (Release 1998) <b>R99</b> (Release 1999) <b>REL-4</b> (Release 4) <b>REL-5</b> (Release 5)

<b>Reason for change:</b>	⌘ Unclear specification of how the multi-domains RABs are handled in the Inter-RAT Handover from UTRAN procedure.
<b>Summary of change:</b>	⌘ It is clarified the Inter-RAT Handover from UTRAN procedure may be used in the case that no RABs are established or when only CS RABs are established or when both CS and PS RABs are established. In the HANDOVER FROM UTRAN COMMAND message only the CS RABs to be handed over are included.  It is clarified also that the Cell Change Order from UTRAN procedure is used only when no RABs are established or when only PS RABs are established. It is also clarified that the PS RABs are not listed in the CELL CHANGE ORDER FROM UTRAN message assuming that the UE will do the mapping between the PS RABs and the SAPI in the GSM/GPRS and therefore re-establish the PDP contexts.  Revision 1 of the CR adds a comment to ASN.1 to ensure that there is no misalignment between the tabular and the ASN.1. Since the IE "rab-InformationList" may be used in a later protocol version, it is proposed that it should not be changed into a dummy The addition is highlighted in <b>yellow</b> .  <b>Isolated impact analysis:</b>  Corrected functionality is Inter-RAT Handover from UTRAN and Cell Change Order from UTRAN with multi-domain RABs <ul style="list-style-type: none"> <li>• « Correction to a function where the specification was :                         <ul style="list-style-type: none"> <li>○ ambiguous or not sufficiently explicit.</li> </ul> </li> </ul> Would not affect implementations behaving like indicated in the CR, would affect implementations supporting the corrected functionality otherwise.

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at <http://www.3gpp.org/specs/CR.htm>. Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

### 8.3.7 Inter-RAT handover from UTRAN

**Figure 8.3.7-1: Inter-RAT handover from UTRAN, successful case**

**Figure 8.3.7-2: Inter-RAT handover from UTRAN, failure case**

#### 8.3.7.1 General

The purpose of the inter-RAT handover procedure is to, under the control of the network, transfer a connection between the UE and UTRAN to another radio access technology (e.g. GSM). This procedure may be used in CELL\_DCH state. This procedure may be used when no RABs are established or when the established RABs are only from CS domain or when the established RABs are from both CS and PS domains.

**NOTE:** This procedure is applicable to CS domain service.

#### 8.3.7.2 Initiation

The procedure is initiated when UTRAN orders a UE in CELL\_DCH state, to make a handover to a radio access technology other than UTRAN, e.g. GSM.

To initiate the procedure, UTRAN sends a HANDOVER FROM UTRAN COMMAND message.

### 8.3.7.3 Reception of a HANDOVER FROM UTRAN COMMAND message by the UE

The UE shall be able to receive a HANDOVER FROM UTRAN COMMAND message and perform an inter-RAT handover, even if no prior UE measurements have been performed on the target cell.

The UE shall:

- 1> establish the connection to the target radio access technology, by using the contents of the IE "Inter-RAT message". This IE contains a message specified in another standard, as indicated by the IE "System type", and carries information about the candidate/ target cell identifier(s) and radio parameters relevant for the target radio access technology. The correspondence between the value of the IE "System type", the standard to apply and the message contained within IE "Inter RAT message" is shown in the following:

Value of the IE "System type"	Standard to apply	Inter RAT Message
GSM	GSM TS 04.18, version 8.5.0 or later	HANDOVER COMMAND
cdma2000	TIA/EIA/IS-2000 or later, TIA/EIA/IS-833 or later, TIA/EIQ/IS-834 or later	

- 1> if the IE "System type" has the value "GSM":

- 2> if the IE "Frequency band" has the value "GSM /DCS 1800 band used":

- 3> set the BAND\_INDICATOR [45] to "ARFCN indicates 1800 band".

- 2> if the IE "Frequency band" has the value " GSM /PCS 1900 band used":

- 3> set the BAND\_INDICATOR [45] to "ARFCN indicates 1900 band".

- 1> apply the "Inter RAT Message" according to the "standard to apply" in the table above.

- 1> if the IE "RAB information List" is included in the HANDOVER FROM UTRAN COMMAND message

- 2> if the IE "RAB information List" includes one IE "RAB Info" with the IE "CN domain Identity" set to "CS domain":

- ~~1> in case one or more IEs "RAB info" is included in the HANDOVER FROM UTRAN COMMAND message:~~

- ~~3> connect upper layer entities corresponding to indicated CS domain RABs to the radio resources indicated in the inter-RAT message.~~

NOTE: In this version of the specification the maximum number of CS RABs which may be included in the IE "RAB information List" is limited to 1.

NOTE: Requirements concerning the establishment of the radio connection towards the other radio access technology and the signalling procedure are outside the scope of this specification.

### 8.3.7.8 Unsupported configuration in HANDOVER FROM UTRAN COMMAND message

If

- the UTRAN instructs the UE to perform a non-supported handover scenario, or
- the UTRAN instructs the UE, e.g. multiple RAB or to use a non-supported configuration, or
- the IE "RAB information List" is included in the HANDOVER FROM UTRAN COMMAND message and this IE does not include any IE "RAB Info" with the IE "CN domain Identity" set to "CS domain";

-the UE shall:

- 1> transmit a HANDOVER FROM UTRAN FAILURE message, setting the information elements as specified below:
  - 2> include the IE "RRC transaction identifier"; and
  - 2> set it to the value of "RRC transaction identifier" in the entry for the HANDOVER FROM UTRAN COMMAND message in the table "Accepted transactions" in the variable TRANSACTIONS; and
  - 2> clear that entry;
  - 2> set the IE "Inter-RAT handover failure" to "configuration unacceptable";
- 2> when the HANDOVER FROM UTRAN FAILURE message has been submitted to lower layers for transmission:
  - 3> resume normal operation as if the invalid HANDOVER FROM UTRAN COMMAND message has not been received;
  - 3> and the procedure ends.

### 8.3.11 Inter-RAT cell change order from UTRAN

Figure 8.3.11-1: Inter-RAT cell change order from UTRAN

Figure 8.3.11-2: Inter-RAT cell change order from UTRAN, failure case

#### 8.3.11.1 General

The purpose of the inter-RAT cell change order procedure is to transfer, under the control of the network, a connection between the UE and UTRAN to another radio access technology (e.g. GSM). This procedure may be used in CELL\_DCH and CELL\_FACH state. This procedure may be used when no RABs are established or when the established RABs are only from PS domain.

~~NOTE: This procedure is applicable for services in the PS domain.~~

#### 8.3.11.2 Initiation

The procedure is initiated when UTRAN orders a UE in CELL\_DCH or CELL\_FACH state, to make a cell change to a radio access technology other than UTRAN, e.g. GSM.

To initiate the procedure, UTRAN sends a CELL CHANGE ORDER FROM UTRAN message.

#### 8.3.11.3 Reception of an CELL CHANGE ORDER FROM UTRAN message by the UE

The UE shall be able to receive a CELL CHANGE ORDER FROM UTRAN message and perform a cell change order to another RAT, even if no prior UE measurements have been performed on the target cell.

The UE shall:

- 1> start timer T309; and
- 1> establish the connection to the other radio access technology, as specified within IE "Target cell description". This IE specifies the target cell identity, in accordance with the specifications for that other RAT. In case the target cell is a GSM/ GPRS cell, IE "Target cell description" may also include IE "NC mode", which specifies the cell selection mode to be applied in the target cell; and
- 1> if IE "NC mode" is not included in the CELL CHANGE ORDER FROM UTRAN:
  - 2> retrieve it from the target cell as specified in [43];

2> act upon IE "NC mode" as specified in [43].

1> if ~~the one or more IEs "RAB info"~~ "RAB Information List" is ~~are~~ included in the CELL CHANGE ORDER FROM UTRAN message:

2> ~~connect the upper layer entities corresponding to indicated RABs to the radio resources offered by the target RAT~~ ignore the contents of the IE "RAB Information List".

NOTE: Requirements concerning the establishment of the radio connection towards the other radio access technology and the signalling procedure are outside the scope of this specification. In case of GSM/GPRS proceed according to the procedure Network control cell reselection procedure as specified in [44].

#### 8.3.11.4 Successful completion of the cell change order

The UE regards the procedure as completed when it has received a successful response from the target RAT, e.g. in case of GSM when it received the response to a (PACKET) CHANNEL REQUEST in the new cell.

Upon successful completion of the cell change order, the UE shall:

1> stop timer T309;

1> clear or set variables upon leaving UTRA RRC connected mode as specified in subclause 13.4.

Upon indication of the UE having successfully completed the cell change order, UTRAN should:

1> release the radio connection; and

1> remove all context information for the concerned UE.

NOTE: The release of the UMTS radio resources is initiated from another RAT.

#### 8.3.11.5 Expiry of timer T309 or UE fails to complete requested cell change order

If:

- timer T309 expires prior to the successful establishment of a connection to the target RAT; or
- if the establishment of the connection to the other RAT failed due to other reasons e.g. (random) access failure, rejection due to lack of resources:

the UE shall:

1> if it received the CELL CHANGE ORDER FROM UTRAN message in state CELL\_DCH:

2> revert back to the UTRA configuration;

2> establish the UTRA physical channel(s) used at the time for reception of CELL CHANGE ORDER FROM UTRAN;

2> if the UE does not succeed in establishing the UTRA physical channel(s):

3> perform a cell update procedure according to subclause 8.3.1 with cause "Radio link failure";

3> when the cell update procedure has completed successfully:

4> proceed as below.

2> transmit the CELL CHANGE ORDER FROM UTRAN FAILURE message setting the information elements as specified below:

3> include the IE "RRC transaction identifier"; and

3> set it to the value of "RRC transaction identifier" in the entry for the received message in the table "Accepted transactions" in the variable TRANSACTIONS; and

3> clear that entry;

- 3> set the IE "Inter-RAT change failure" to "physical channel failure".
- 2> When the CELL CHANGE ORDER FROM UTRAN FAILURE message has been submitted to lower layer for transmission, the procedure ends.
- 1> if the UE receives the CELL CHANGE ORDER FROM UTRAN message in CELL\_FACH state:
  - 2> revert to the cell it was camped on at the reception of the CELL CHANGE ORDER FROM UTRAN message;
  - 2> if the UE is unable to return to this cell:
    - 3> select a suitable UTRA cell according to [4];
    - 3> initiate the cell update procedure according to subclause 8.3.1 using the cause "cell re-selection";
    - 3> when the cell update procedure completed successfully:
      - 4> proceed as below.
  - 2> transmit the CELL CHANGE ORDER FROM UTRAN FAILURE message setting the information elements as specified below:
    - 3> include the IE "RRC transaction identifier"; and
    - 3> set it to the value of "RRC transaction identifier" in the entry for the CELL CHANGE ORDER FROM UTRAN message in the table "Accepted transactions" in the variable TRANSACTIONS; and
    - 3> clear that entry;
    - 3> set the IE "Inter-RAT change failure" to "physical channel failure".
- 2> When the CELL CHANGE ORDER FROM UTRAN FAILURE message has been submitted to lower layer for transmission:
  - 3> the procedure ends.

### 8.3.11.6 Unsupported configuration in CELL CHANGE ORDER FROM UTRAN message

If the UTRAN instructs the UE to perform a non-supported cell change order scenario ~~e.g. multiple RAB~~ or to use a non-supported configuration, the UE shall:

- 1> transmit a CELL CHANGE ORDER FROM UTRAN FAILURE message, setting the information elements as specified below:
  - 2> include the IE "RRC transaction identifier"; and
  - 2> set it to the value of "RRC transaction identifier" in the entry for the received message in the table "Accepted transactions" in the variable TRANSACTIONS; and
  - 2> clear that entry;
  - 2> set the IE "Inter-RAT change failure" to "configuration unacceptable";
- 2> when the CELL CHANGE ORDER FROM UTRAN FAILURE message has been submitted to lower layers for transmission:
  - 3> resume normal operation as if the CELL CHANGE ORDER FROM UTRAN message has not been received;
  - 3> and the procedure ends.

## 10.2.5 CELL CHANGE ORDER FROM UTRAN

This message is used to order a cell change from UTRA to another radio access technology, e.g., GSM.

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at <http://www.3gpp.org/specs/CR.htm>.

Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

### 8.3.7 Inter-RAT handover from UTRAN

Figure 8.3.7-1: Inter-RAT handover from UTRAN, successful case

Figure 8.3.7-2: Inter-RAT handover from UTRAN, failure case

#### 8.3.7.1 General

The purpose of the inter-RAT handover procedure is to, under the control of the network, transfer a connection between the UE and UTRAN to another radio access technology (e.g. GSM). This procedure may be used in CELL\_DCH state. This procedure may be used when no RABs are established or when the established RABs are only from CS domain or when the established RABs are from both CS and PS domains.

~~NOTE: This procedure is applicable to CS domain service.~~

#### 8.3.7.2 Initiation

The procedure is initiated when UTRAN orders a UE in CELL\_DCH state, to make a handover to a radio access technology other than UTRAN, e.g. GSM.

To initiate the procedure, UTRAN sends a HANDOVER FROM UTRAN COMMAND message.

### 8.3.7.3 Reception of a HANDOVER FROM UTRAN COMMAND message by the UE

The UE shall be able to receive a HANDOVER FROM UTRAN COMMAND message and perform an inter-RAT handover, even if no prior UE measurements have been performed on the target cell.

The UE shall:

- 1> establish the connection to the target radio access technology, by using the contents of the IE "Inter-RAT message". This IE contains a message specified in another standard, as indicated by the IE "System type", and carries information about the candidate/ target cell identifier(s) and radio parameters relevant for the target radio access technology. The correspondence between the value of the IE "System type", the standard to apply and the message contained within IE "Inter RAT message" is shown in the following:

Value of the IE "System type"	Standard to apply	Inter RAT Message
GSM	GSM TS 04.18, version 8.5.0 or later	HANDOVER COMMAND
cdma2000	TIA/EIA/IS-2000 or later, TIA/EIA/IS-833 or later, TIA/EIQ/IS-834 or later	

- 1> if the IE "System type" has the value "GSM":
  - 2> if the IE "Frequency band" has the value "GSM /DCS 1800 band used":
    - 3> set the BAND\_INDICATOR [45] to "ARFCN indicates 1800 band".
  - 2> if the IE "Frequency band" has the value " GSM /PCS 1900 band used":
    - 3> set the BAND\_INDICATOR [45] to "ARFCN indicates 1900 band".

- 1> apply the "Inter RAT Message" according to the "standard to apply" in the table above.

1> if the IE "RAB information List" is included in the HANDOVER FROM UTRAN COMMAND message

2> if the IE "RAB information List" includes one IE "RAB Info" with the IE "CN domain Identity" set to "CS domain":

~~1> in case one or more IEs "RAB info" is included in the HANDOVER FROM UTRAN COMMAND message:~~

~~32> connect upper layer entities corresponding to indicated CS domain RABs to the radio resources indicated in the inter-RAT message.~~

NOTE: In this version of the specification the maximum number of CS RABs which may be included in the IE "RAB information List" is limited to 1.

NOTE: Requirements concerning the establishment of the radio connection towards the other radio access technology and the signalling procedure are outside the scope of this specification.

### 8.3.7.8 Unsupported configuration in HANDOVER FROM UTRAN COMMAND message

If

- ~~the UTRAN instructs the UE to perform a non-supported handover scenario, ore.g. multiple RAB or~~
- ~~the UTRAN instructs the UE to use a non-supported configuration, or~~
- the IE "RAB information List" is included in the HANDOVER FROM UTRAN COMMAND message and this IE does not include any IE "RAB Info" with the IE "CN domain Identity" set to "CS domain",

the UE shall:

- 1> transmit a HANDOVER FROM UTRAN FAILURE message, setting the information elements as specified below:
  - 2> include the IE "RRC transaction identifier"; and
  - 2> set it to the value of "RRC transaction identifier" in the entry for the HANDOVER FROM UTRAN COMMAND message in the table "Accepted transactions" in the variable TRANSACTIONS; and
  - 2> clear that entry;
  - 2> set the IE "Inter-RAT handover failure" to "configuration unacceptable";
- 2> when the HANDOVER FROM UTRAN FAILURE message has been submitted to lower layers for transmission:
  - 3> resume normal operation as if the invalid HANDOVER FROM UTRAN COMMAND message has not been received;
  - 3> and the procedure ends.

### 8.3.11 Inter-RAT cell change order from UTRAN

**Figure 8.3.11-1: Inter-RAT cell change order from UTRAN**

**Figure 8.3.11-2: Inter-RAT cell change order from UTRAN, failure case**

#### 8.3.11.1 General

The purpose of the inter-RAT cell change order procedure is to transfer, under the control of the network, a connection between the UE and UTRAN to another radio access technology (e.g. GSM). This procedure may be used in CELL\_DCH and CELL\_FACH state. This procedure may be used when no RABs are established or when the established RABs are only from PS domain.

~~NOTE: This procedure is applicable for services in the PS domain.~~

#### 8.3.11.2 Initiation

The procedure is initiated when UTRAN orders a UE in CELL\_DCH or CELL\_FACH state, to make a cell change to a radio access technology other than UTRAN, e.g. GSM.

To initiate the procedure, UTRAN sends a CELL CHANGE ORDER FROM UTRAN message.

#### 8.3.11.3 Reception of an CELL CHANGE ORDER FROM UTRAN message by the UE

The UE shall be able to receive a CELL CHANGE ORDER FROM UTRAN message and perform a cell change order to another RAT, even if no prior UE measurements have been performed on the target cell.

The UE shall:

- 1> start timer T309; and
- 1> establish the connection to the other radio access technology, as specified within IE "Target cell description". This IE specifies the target cell identity, in accordance with the specifications for that other RAT. In case the target cell is a GSM/ GPRS cell, IE "Target cell description" may also include IE "NC mode", which specifies the cell selection mode to be applied in the target cell; and
- 1> if IE "NC mode" is not included in the CELL CHANGE ORDER FROM UTRAN:

- 2> retrieve it from the target cell as specified in [43];
- 2> act upon IE "NC mode" as specified in [43].

1> if the IE "RAB Information List" is ~~one or more IEs "RAB info" are~~ included in the CELL CHANGE ORDER FROM UTRAN message:

- 2> ~~ignore the contents of the IE "RAB Information List". connect the upper layer entities corresponding to indicated RABs to the radio resources offered by the target RAT.~~

NOTE: Requirements concerning the establishment of the radio connection towards the other radio access technology and the signalling procedure are outside the scope of this specification. In case of GSM/GPRS proceed according to the procedure Network control cell reselection procedure as specified in [44].

#### 8.3.11.4 Successful completion of the cell change order

The UE regards the procedure as completed when it has received a successful response from the target RAT, e.g. in case of GSM when it received the response to a (PACKET) CHANNEL REQUEST in the new cell.

Upon successful completion of the cell change order, the UE shall:

- 1> stop timer T309;
- 1> clear or set variables upon leaving UTRA RRC connected mode as specified in subclause 13.4.

Upon indication of the UE having successfully completed the cell change order, UTRAN should:

- 1> release the radio connection; and
- 1> remove all context information for the concerned UE.

NOTE: The release of the UMTS radio resources is initiated from another RAT.

#### 8.3.11.5 Expiry of timer T309 or UE fails to complete requested cell change order

If:

- timer T309 expires prior to the successful establishment of a connection to the target RAT; or
- if the establishment of the connection to the other RAT failed due to other reasons e.g. (random) access failure, rejection due to lack of resources:

the UE shall:

- 1> if it received the CELL CHANGE ORDER FROM UTRAN message in state CELL\_DCH:
  - 2> revert back to the UTRA configuration;
  - 2> establish the UTRA physical channel(s) used at the time for reception of CELL CHANGE ORDER FROM UTRAN;
  - 2> if the UE does not succeed in establishing the UTRA physical channel(s):
    - 3> perform a cell update procedure according to subclause 8.3.1 with cause "Radio link failure";
    - 3> when the cell update procedure has completed successfully:
      - 4> proceed as below.
  - 2> transmit the CELL CHANGE ORDER FROM UTRAN FAILURE message setting the information elements as specified below:
    - 3> include the IE "RRC transaction identifier"; and
    - 3> set it to the value of "RRC transaction identifier" in the entry for the received message in the table "Accepted transactions" in the variable TRANSACTIONS; and

- 3> clear that entry;
- 3> set the IE "Inter-RAT change failure" to "physical channel failure".
- 2> When the CELL CHANGE ORDER FROM UTRAN FAILURE message has been submitted to lower layer for transmission, the procedure ends.
- 1> if the UE receives the CELL CHANGE ORDER FROM UTRAN message in CELL\_FACH state:
  - 2> revert to the cell it was camped on at the reception of the CELL CHANGE ORDER FROM UTRAN message;
  - 2> if the UE is unable to return to this cell:
    - 3> select a suitable UTRA cell according to [4];
    - 3> initiate the cell update procedure according to subclause 8.3.1 using the cause "cell re-selection";
    - 3> when the cell update procedure completed successfully:
      - 4> proceed as below.
  - 2> transmit the CELL CHANGE ORDER FROM UTRAN FAILURE message setting the information elements as specified below:
    - 3> include the IE "RRC transaction identifier"; and
    - 3> set it to the value of "RRC transaction identifier" in the entry for the CELL CHANGE ORDER FROM UTRAN message in the table "Accepted transactions" in the variable TRANSACTIONS; and
    - 3> clear that entry;
    - 3> set the IE "Inter-RAT change failure" to "physical channel failure".
  - 2> When the CELL CHANGE ORDER FROM UTRAN FAILURE message has been submitted to lower layer for transmission:
    - 3> the procedure ends.

### 8.3.11.6 Unsupported configuration in CELL CHANGE ORDER FROM UTRAN message

If the UTRAN instructs the UE to perform a non-supported cell change order scenario ~~e.g. multiple RAB~~ or to use a non-supported configuration, the UE shall:

- 1> transmit a CELL CHANGE ORDER FROM UTRAN FAILURE message, setting the information elements as specified below:
  - 2> include the IE "RRC transaction identifier"; and
  - 2> set it to the value of "RRC transaction identifier" in the entry for the received message in the table "Accepted transactions" in the variable TRANSACTIONS; and
  - 2> clear that entry;
  - 2> set the IE "Inter-RAT change failure" to "configuration unacceptable";
  - 2> when the CELL CHANGE ORDER FROM UTRAN FAILURE message has been submitted to lower layers for transmission:
    - 3> resume normal operation as if the CELL CHANGE ORDER FROM UTRAN message has not been received;
    - 3> and the procedure ends.

## 10.2.5 CELL CHANGE ORDER FROM UTRAN

This message is used to order a cell change from UTRA to another radio access technology, e.g., GSM.

## CHANGE REQUEST

⌘ **25.331 CR 1459** ⌘ rev **r1** ⌘ Current version: **5.0.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** ⌘ (U)SIM  ME/UE  Radio Access Network  Core Network

<b>Title:</b>	⌘ Correction to 3G to 2G Inter-RAT handover for multi-domain RABs		
<b>Source:</b>	⌘ TSG-RAN WG2		
<b>Work item code:</b>	⌘ TEI	<b>Date:</b>	⌘ 13 <sup>th</sup> - May 2002
<b>Category:</b>	⌘ <b>A</b>	<b>Release:</b>	⌘ REL-5
	<i>Use <u>one</u> of the following categories:</i> <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP TR 21.900.		<i>Use <u>one</u> of the following releases:</i> <b>2</b> (GSM Phase 2) <b>R96</b> (Release 1996) <b>R97</b> (Release 1997) <b>R98</b> (Release 1998) <b>R99</b> (Release 1999) <b>REL-4</b> (Release 4) <b>REL-5</b> (Release 5)

<b>Reason for change:</b>	⌘ Unclear specification of how the multi-domains RABs are handled in the Inter-RAT Handover from UTRAN procedure.
<b>Summary of change:</b>	⌘ It is clarified the Inter-RAT Handover from UTRAN procedure may be used in the case that no RABs are established or when only CS RABs are established or when both CS and PS RABs are established. In the HANDOVER FROM UTRAN COMMAND message only the CS RABs to be handed over are included.  It is clarified also that the Cell Change Order from UTRAN procedure is used only when no RABs are established or when only PS RABs are established. It is also clarified that the PS RABs are not listed in the CELL CHANGE ORDER FROM UTRAN message assuming that the UE will do the mapping between the PS RABs and the SAPI in the GSM/GPRS and therefore re-establish the PDP contexts.  Revision 1 of the CR adds a comment to ASN.1 to ensure that there is no misalignment between the tabular and the ASN.1. Since the IE "rab-InformationList" may be used in a later protocol version, it is proposed that it should not be changed into a dummy The addition is highlighted in <b>yellow</b> .
<b>Consequences if not approved:</b>	⌘ The UE behavior is not clearly specified

<b>Clauses affected:</b>	⌘ 8.3.7.1, 8.3.7.3, 8.3.7.8, 8.3.11.1, 8.3.11.3, 8.3.11.4, 8.3.11.6, 10.2.5, 11.2	
<b>Other specs affected:</b>	⌘ <input type="checkbox"/> Other core specifications <input type="checkbox"/> Test specifications <input type="checkbox"/> O&M Specifications	⌘ 25.331 v3.10.0, CR 1457r1 25.331 v4.4.0, CR 1458r1

**Other comments:** ☹

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at <http://www.3gpp.org/specs/CR.htm>. Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ☹ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

### 8.3.7 Inter-RAT handover from UTRAN

**Figure 8.3.7-1: Inter-RAT handover from UTRAN, successful case**

**Figure 8.3.7-2: Inter-RAT handover from UTRAN, failure case**

#### 8.3.7.1 General

The purpose of the inter-RAT handover procedure is to, under the control of the network, transfer a connection between the UE and UTRAN to another radio access technology (e.g. GSM). This procedure may be used in CELL\_DCH state. This procedure may be used when no RABs are established or when the established RABs are only from CS domain or when the established RABs are from both CS and PS domains.

~~NOTE: This procedure is applicable to CS domain service.~~

#### 8.3.7.2 Initiation

The procedure is initiated when UTRAN orders a UE in CELL\_DCH state, to make a handover to a radio access technology other than UTRAN, e.g. GSM.

To initiate the procedure, UTRAN sends a HANDOVER FROM UTRAN COMMAND message.

### 8.3.7.3 Reception of a HANDOVER FROM UTRAN COMMAND message by the UE

The UE shall be able to receive a HANDOVER FROM UTRAN COMMAND message and perform an inter-RAT handover, even if no prior UE measurements have been performed on the target cell.

The UE shall:

- 1> establish the connection to the target radio access technology, by using the contents of the IE "Inter-RAT message". This IE contains a message specified in another standard, as indicated by the IE "System type", and carries information about the candidate/ target cell identifier(s) and radio parameters relevant for the target radio access technology. The correspondence between the value of the IE "System type", the standard to apply and the message contained within IE "Inter RAT message" is shown in the following:

Value of the IE "System type"	Standard to apply	Inter RAT Message
GSM	GSM TS 04.18, version 8.5.0 or later	HANDOVER COMMAND
cdma2000	TIA/EIA/IS-2000 or later, TIA/EIA/IS-833 or later, TIA/EIQ/IS-834 or later	

- 1> if the IE "System type" has the value "GSM":
  - 2> if the IE "Frequency band" has the value "GSM /DCS 1800 band used":
    - 3> set the BAND\_INDICATOR [45] to "ARFCN indicates 1800 band".
  - 2> if the IE "Frequency band" has the value " GSM /PCS 1900 band used":
    - 3> set the BAND\_INDICATOR [45] to "ARFCN indicates 1900 band".

1> apply the "Inter RAT Message" according to the "standard to apply" in the table above.

1> if the IE "RAB information List" is included in the HANDOVER FROM UTRAN COMMAND message

2> if the IE "RAB information List" includes one IE "RAB Info" with the IE "CN domain Identity" set to "CS domain":

~~1> in case one or more IEs "RAB info" is included in the HANDOVER FROM UTRAN COMMAND message:~~

~~3> connect upper layer entities corresponding to indicated CS domain RABs to the radio resources indicated in the inter-RAT message.~~

NOTE: In this version of the specification the maximum number of CS RABs which may be included in the IE "RAB information List" is limited to 1.

NOTE: Requirements concerning the establishment of the radio connection towards the other radio access technology and the signalling procedure are outside the scope of this specification.

### 8.3.7.8 Unsupported configuration in HANDOVER FROM UTRAN COMMAND message

If

- the UTRAN instructs the UE to perform a non-supported handover scenario, or
- the UTRAN instructs the UE ~~e.g. multiple RAB~~ or to use a non-supported configuration, or
- the IE "RAB information List" is included in the HANDOVER FROM UTRAN COMMAND message and this IE does not include any IE "RAB Info" with the IE "CN domain Identity" set to "CS domain".

the UE shall:

- 1> transmit a HANDOVER FROM UTRAN FAILURE message, setting the information elements as specified below:
  - 2> include the IE "RRC transaction identifier"; and
  - 2> set it to the value of "RRC transaction identifier" in the entry for the HANDOVER FROM UTRAN COMMAND message in the table "Accepted transactions" in the variable TRANSACTIONS; and
  - 2> clear that entry;
  - 2> set the IE "Inter-RAT handover failure" to "configuration unacceptable";
  - 2> when the HANDOVER FROM UTRAN FAILURE message has been submitted to lower layers for transmission:
    - 3> resume normal operation as if the invalid HANDOVER FROM UTRAN COMMAND message has not been received;
    - 3> and the procedure ends.

### 8.3.11 Inter-RAT cell change order from UTRAN

**Figure 8.3.11-1: Inter-RAT cell change order from UTRAN**

**Figure 8.3.11-2: Inter-RAT cell change order from UTRAN, failure case**

#### 8.3.11.1 General

The purpose of the inter-RAT cell change order procedure is to transfer, under the control of the network, a connection between the UE and UTRAN to another radio access technology (e.g. GSM). This procedure may be used in CELL\_DCH and CELL\_FACH state. This procedure may be used when no RABs are established or when the established RABs are only from PS domain.

~~NOTE: This procedure is applicable for services in the PS domain.~~

#### 8.3.11.2 Initiation

The procedure is initiated when UTRAN orders a UE in CELL\_DCH or CELL\_FACH state, to make a cell change to a radio access technology other than UTRAN, e.g. GSM.

To initiate the procedure, UTRAN sends a CELL CHANGE ORDER FROM UTRAN message.

#### 8.3.11.3 Reception of an CELL CHANGE ORDER FROM UTRAN message by the UE

The UE shall be able to receive a CELL CHANGE ORDER FROM UTRAN message and perform a cell change order to another RAT, even if no prior UE measurements have been performed on the target cell.

The UE shall:

- 1> start timer T309; and
- 1> establish the connection to the other radio access technology, as specified within IE "Target cell description". This IE specifies the target cell identity, in accordance with the specifications for that other RAT. In case the target cell is a GSM/ GPRS cell, IE "Target cell description" may also include IE "NC mode", which specifies the cell selection mode to be applied in the target cell; and
- 1> if IE "NC mode" is not included in the CELL CHANGE ORDER FROM UTRAN:
  - 2> retrieve it from the target cell as specified in [43];

2> act upon IE "NC mode" as specified in [43].

1> if the "RAB Information List" is one or more IEs "RAB info" are included in the CELL CHANGE ORDER FROM UTRAN message:

2> ignore the contents of the IE "RAB Information List" ~~connect the upper layer entities corresponding to indicated RABs to the radio resources offered by the target RAT.~~

NOTE: Requirements concerning the establishment of the radio connection towards the other radio access technology and the signalling procedure are outside the scope of this specification. In case of GSM/GPRS proceed according to the procedure Network control cell reselection procedure as specified in [44].

#### 8.3.11.4 Successful completion of the cell change order

The UE regards the procedure as completed when it has received a successful response from the target RAT, e.g. in case of GSM when it received the response to a (PACKET) CHANNEL REQUEST in the new cell.

Upon successful completion of the cell change order, the UE shall:

1> stop timer T309;

1> clear or set variables upon leaving UTRA RRC connected mode as specified in subclause 13.4.

Upon indication of the UE having successfully completed the cell change order, UTRAN should:

1> release the radio connection; and

1> remove all context information for the concerned UE.

NOTE: The release of the UMTS radio resources is initiated from another RAT.

### 8.3.11.6 Unsupported configuration in CELL CHANGE ORDER FROM UTRAN message

If the UTRAN instructs the UE to perform a non-supported cell change order scenario ~~e.g. multiple RAB~~ or to use a non-supported configuration, the UE shall:

- 1> transmit a CELL CHANGE ORDER FROM UTRAN FAILURE message, setting the information elements as specified below:
  - 2> include the IE "RRC transaction identifier"; and
  - 2> set it to the value of "RRC transaction identifier" in the entry for the received message in the table "Accepted transactions" in the variable TRANSACTIONS; and
  - 2> clear that entry;
  - 2> set the IE "Inter-RAT change failure" to "configuration unacceptable";
- 2> when the CELL CHANGE ORDER FROM UTRAN FAILURE message has been submitted to lower layers for transmission:
  - 3> resume normal operation as if the CELL CHANGE ORDER FROM UTRAN message has not been received;
  - 3> and the procedure ends.

## 10.2.5 CELL CHANGE ORDER FROM UTRAN

This message is used to order a cell change from UTRA to another radio access technology, e.g., GSM.

Use <u>one</u> of the following releases: 2 (GSM Phase 2) R96 (Release 1996) R97 (Release 1997) R98 (Release 1998) R99 (Release 1999) REL-4 (Release 4) REL-5 (Release 5)

<b>Reason for change:</b>	⌘ Confusion between BLER measurement and DCH quality target: DCH quality target is not always applicable when BLER measurement is applicable.
<b>Summary of change:</b>	⌘ Erroneous reference to applicability of BLER measurement is deleted from 8.6.5.4  It is clarified that, even though BLER measurement is in some cases possible when CRC exists in <b>at least one</b> transport format in downlink TFS, DCH quality target is only possible when CRC exists in <b>all</b> transport formats in downlink TFS.  <b>Impact analysis:</b> This CR is considered to have isolated impact. If the UE does not implement this CR, it may wrongly apply the quality target for a DCH.
<b>Consequences if not approved:</b>	⌘ 25.331 conflicts with 25.215.

<b>Clauses affected:</b>	⌘ 8.6.5.4		
<b>Other specs affected:</b>	⌘ <input type="checkbox"/> Other core specifications <input type="checkbox"/> Test specifications <input type="checkbox"/> O&M Specifications	⌘	25.331 v4.4.0, CR 1461 25.331 v5.0.0, CR 1462
<b>Other comments:</b>	⌘		

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at: [http://www.3gpp.org/3G\\_Specs/CRs.htm](http://www.3gpp.org/3G_Specs/CRs.htm). Below is a brief summary:

1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.

2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.

3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request

#### 8.6.5.4 DCH quality target

At physical channel establishment, the UE sets an initial downlink target SIR value based on the received IEs "DCH quality target". The IE "DCH quality target" for a given DCH shall be used by the UE to set the target SIR for the downlink power control in case ~~BLER measurement~~quality target can be set ~~is possible~~ for this DCH, i.e. CRC exists in all transport formats in downlink TFS for this DCH.
