Title: Response to liaison on UE measurement abilities

RAN WG2 thanks RAN WG1 for liaison R2-99d99 on UE measurement abilities and has the following responses to the questions raised:

- It is the assumption of RAN2 that the UTRAN may request a UE to perform concurrent measurements. It will be the responsibility of the UTRAN to ensure that the combination of measurements requested and any compressed mode configuration is reasonable
- The RAN2 specifications do not associate a purpose with the compressed mode pattern– i.e. the compressed mode pattern configuration and the measurement requests are signalled independently. However, RAN2 would like to know RAN1's view on whether it is beneficial for an intended purpose to be associated with each compressed mode gap.
- RAN WG2 assumes that performance requirements (i.e. how much time the UE is allowed for it) for each type of measurements will be specified by RAN WG4.
