RAN2 would like to thank RAN3 for the LS concerning the delay budget within UTRAN for H.324.

RAN2's working assumption is that circuit switched multimedia services typically use transparent RLC mode where no retransmissions are possible. Transparent RLC has the benefit of not adding any transmission delay.

RAN2 sees also a possibility to use acknowledged mode RLC with one retransmission and 20 ms interleaving depth but this scheme has not been thoroughly investigated in RAN2.
