### How to create CRs using this form:

Comprehensive information and tips about how to create CRs can be found at: [http://www.3gpp.org/3G\\_Specs/CRs.htm](http://www.3gpp.org/3G_Specs/CRs.htm). Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/>. For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

---

## Annex B (informative): Mapping of SDP parameters to UMTS QoS parameters

This clause gives recommendations for mapping of SDP parameters in UMTS QoS parameters- [for conversational multimedia applications. Different use cases will be considered. Each use case generates an example QoS profile parameters table. The values indicated are derived by applications' QoS requirements, and may not be fulfilled by the network. In the parameters for guaranteed and maximum bit rates a granularity of 1 kbps is assumed for bearers up to 64 kbps, as defined in the TS 24.008. Therefore the "Ceiling" function is used for up-rounding fractional values, wherever needed. In addition, the same specification defines a granularity of 10 bytes for the Maximum SDU sizes values. This is taken into account in the computation of this field in the QoS profile.](#)

**Table B.1 Mapping for conversational application**

<b>QoS-parameter</b>	<b>Parameter-value</b>	<b>comment</b>
<b>Delivery-of-erroneous SDUs</b>	"no"	
<b>Delivery-order</b>	Yes	
<b>Traffic-class</b>	"Conversational-class"	
<b>Maximum-SDU-size</b>	[TBD]	
<b>Guaranteed bit rate for downlink</b>	SDP-media bw in downlink direction + 2.5% (media bw in downlink + media bw in uplink direction)	Per media type
<b>Maximum bit rate for downlink</b>	Equal or higher to guaranteed bit rate in downlink	
<b>Guaranteed bit rate for uplink</b>	SDP-media bw in uplink direction + 2.5% (media bw in downlink + media bw in uplink direction)	Per media type
<b>Maximum bit rate for uplink</b>	Equal or higher to guaranteed bit rate in uplink	
<b>Residual BER</b>	$1 \cdot 10^{-5}$ [TBC]	16 bit CRC should be enough
<b>SDU error ratio</b>	$7 \cdot 10^{-3}$ or less for AMR-NB and AMR-WB  $10^{-4}$ for the rest	
<b>Traffic handling priority</b>	Subscribed traffic handling priority	Ignored
<b>Transfer delay</b>	100 ms AMR (NB and WB)  150 ms H.263 and MPEG-4 video  [TBD] others	Target values

**Use case 1 – Voice over IP**

This use case includes the scenario in which two conversational multimedia terminals establish a bi-directional Voice over IP (VoIP) connection for speech communication, using the AMR or AMR-WB codecs with the same bit rate in both uplink and downlink directions.

For example an AMR VoIP stream encoded at 12.2 kbps, with one speech frame encapsulated into an RTP packet, would yield IP packets of the following size (using the mandated bandwidth efficient mode):

20 (IPv4) + 8 (UDP) + 12 (RTP) + 32 (AMR RTP payload) = 72 bytes, or

40 (IPv6 with no extension headers) + 8 (UDP) + 12 (RTP) + 32 (AMR RTP payload) = 92 bytes.

The gross bit rate including uncompressed RTP/UDP/IPv4 headers would be 28.8 kbps. The value in the b=AS media level parameter would be 29.

To determine the Maximum SDU size parameter we should consider the maximum packet size that can be generated with a speech codec. This is exactly that generated by a AMR-WB stream at 23.85 kbps packetized in bandwidth efficient mode and with 1 speech frame per packet. Considering uncompressed RTP/UDP/IPv6 headers, the maximum packet size is 121 bytes.

The QoS profile would be set then using the following parameters:

<u>QoS parameter</u>	<u>Parameter value</u>	<u>Comment</u>
<u>Delivery of erroneous SDUs</u>	<u>No</u>	
<u>Delivery order</u>	<u>No</u>	<u>To minimize delay in the access stratum. The application should take care of eventual packet reordering</u>
<u>Traffic class</u>	<u>Conversational</u>	
<u>Maximum SDU size</u>	<u>130 bytes</u>	<u>10 bytes granularity. The RTCP packet size might change the maximum SDU size limitation [tbc]</u>
<u>Guaranteed bitrate for downlink</u>	<u>SDP media bw in DL + 2.5% * (SDP media bw in DL+ SDP media bw in UL) = Ceil(30.45)=31 kbps</u>	
<u>Maximum bit rate for downlink</u>	<u>Ceil(30.45)=31 kbps</u>	
<u>Guaranteed bitrate for uplink</u>	<u>SDP media bw in UL + 2.5% * (SDP media bw in UL+ SDP media bw in DL) = Ceil(30.45)=31 kbps</u>	
<u>Maximum bit rate for uplink</u>	<u>Ceil(30.45)=31 kbps</u>	
<u>Residual BER</u>	<u>10<sup>-5</sup></u>	<u>16 bit CRC</u>
<u>SDU error ratio</u>	<u>7*10<sup>-3</sup></u>	
<u>Traffic handling priority</u>	<u>Subscribed traffic handling priority</u>	<u>Not relevant</u>
<u>Transfer delay</u>	<u>100 ms</u>	
<u>SDU format information</u>	<u>Not used</u>	
<u>Allocation/retention priority</u>	<u>Subscribed traffic handling priority</u>	<u>Not relevant</u>
<u>Source statistics descriptor</u>	<u>"Speech"</u>	

Table B.1: QoS profile for AMR VoIP at 12.2 kbps

In some cases, multiple AMR or AMR-WB rates are available, and rate control techniques allow to switch between different modes based on the received speech quality. For example, if the available AMR mode set is {4.75, 10.2, 12.2} kbps, the set of gross bit rates are:

AMR 4.75 kbps: 21.6 kbps (including RTP/UDP/IPv4 headers). [SDP b=AS parameter would be 22].

[AMR 10.2 kbps: 26.8 kbps \(including RTP/UDP/IPv4 headers\). \[SDP b=AS parameter would be 27\].](#)

[AMR 12.2 kbps: 28.8 kbps \(including RTP/UDP/IPv4 headers\). \[SDP b=AS parameter would be 29\].](#)

[The maximum bit rate is set to the highest mode of the codec. However, the procedure on how to choose the guaranteed bit rate when several codec rates are available is to be defined. Here we provide an example QoS profile in which the guaranteed speech quality is at least that of 10.2 kbps AMR for both uplink and downlink directions, while the non-guaranteed maximum quality is that of 12.2 kbps for both uplink and downlink directions.](#)

[Table B.2: QoS profile for AMR VoIP at 3 bit rates with rate control](#)

## [Use case 2 – Unidirectional video](#)

[This use case includes the scenario in which two conversational multimedia terminals establish a uni-directional video connection, using the H.263 or MPEG-4 codecs.](#)

The video codec in this example has a bitrate of 36 kbps, with RTP payload packets of 75 bytes (excluding payload header which is, for example, 2 bytes). The sending terminal would produce IP packets of the following size:

$20 \text{ (IPv4)} + 8 \text{ (UDP)} + 12 \text{ (RTP)} + 77 \text{ (video RTP payload+payload header)} = 117 \text{ bytes, or}$

$40 \text{ (IPv6 with no extension headers)} + 8 \text{ (UDP)} + 12 \text{ (RTP)} + 77 \text{ (video RTP payload+payload header)} = 137 \text{ bytes.}$

The gross bit rate including uncompressed RTP/UDP/IPv4 headers would be 56.2 kbps. The value in the b=AS media level parameter would be 57.

The maximum video packet size is limited to 512 bytes in section 5.2. This value is fine if transmission occurs over the UMTS Iu interface. However, in order to avoid fragmentation of IP packets over the GERAN Gb interface (where the default size for LLC data field (=SNDCP frame) is 500 bytes) the maximum IP packet size is  $500 - 4 \text{ (unacknowledged mode SNDCP header)} = 496 \text{ bytes}$ . Therefore, the maximum size of a video packet is  $496 - 60 \text{ (RTP/UDP/IPv6 uncompressed headers)} = 436 \text{ bytes}$  (including RTP payload header). 400 bytes is a safer value.

The QoS profile of the receiving terminal would be set then using the following parameters:

QoS parameter	Parameter value	Comment
Delivery of erroneous SDUs	No	
Delivery order	No	To minimize delay in the access stratum. The application should take care of eventual packet reordering
Traffic class	Conversational	
Maximum SDU size	500 bytes	10 bytes granularity
Guaranteed bitrate for downlink	SDP media bw in DL + $2.5\% * (\text{SDP media bw in DL}) =$ $\text{Ceil}(58.43)=59 \text{ kbps}$	
Maximum bit rate for downlink	Equal or higher than guaranteed bit rate	
Guaranteed bitrate for uplink	$2.5\% * (\text{SDP media bw in DL}) =$ $\text{Ceil}(1.43)=2 \text{ kbps}$	For RTCP
Maximum bit rate for uplink	Equal or higher than guaranteed bit rate	
Residual BER	$10^{-5}$	16 bit CRC
SDU error ratio	$10^{-3}$	
Traffic handling priority	Subscribed traffic handling priority	Not relevant
Transfer delay	250 ms	
SDU format information	Not used	
Allocation/retention priority	Subscribed traffic handling priority	Not relevant
Source statistics descriptor	"Unknown"	

Table B.3: QoS profile for unidirectional video at 36 kbps

### Use case 3 – Video telephony

This use case includes the scenario in which two conversational multimedia terminals establish a bi-directional speech/video connection, using the AMR/AMR-WB and H.263/MPEG-4 codecs at the same bit rates in uplink and downlink directions.

The video codec in this case has a bitrate of 28 kbps, with RTP payload packets of 250 bytes (excluding payload header which is, for example, 2 bytes). The total video bit rate is 32.7 kbps (including RTP/UDP/IPv4 headers). The value in the b=AS media level parameter would be 33. In the same bearer there is an AMR stream at 10.2 kbps with 1 frame encapsulated per RTP packet using the bandwidth efficient mode. The total voice bit rate is 26.8 kbps (including RTP/UDP/IPv4 headers). The value in the b=AS media level parameter would be 27. The total media bit rate is  $28+10.2=38.2$  kbps. The total session bit rate is  $33+27=60$  kbps.

The terminal would produce IP packets of the following size:

AMR:  $20$  (IPv4) +  $8$  (UDP) +  $12$  (RTP) +  $27$  (AMR RTP payload) = 67 bytes (or 87 bytes for IPv6 with no extension headers).

Video:  $20$  (IPv4) +  $8$  (UDP) +  $12$  (RTP) +  $252$  (video RTP payload+payload header) = 292 bytes (or 312 bytes for IPv6 with no extension headers).

The same considerations done in Use Case 2 about the maximum packet sizes apply also for this use case.

The QoS profile of the videotelephony terminal would be set then using the following parameters:

QoS parameter	Parameter value	Comment
Delivery of erroneous SDUs	No	
Delivery order	No	To minimize delay in the access stratum. The application should take care of eventual packet reordering
Traffic class	Conversational	
Maximum SDU size	500 bytes	10 bytes granularity
Guaranteed bitrate for downlink	SDP media bw in DL for AMR + $2.5\% * (\text{SDP media bw in DL for AMR} + \text{SDP media bw in UL for AMR}) +$  SDP media bw in DL for video + $2.5\% * (\text{SDP media bw in DL for video} + \text{SDP media bw in UL for video})$ = 63 kbps	
Maximum bit rate for downlink	Equal or higher than guaranteed bit rate	
Guaranteed bitrate for uplink	SDP media bw in UL for AMR + $2.5\% * (\text{SDP media bw in UL for AMR} + \text{SDP media bw in DL for AMR}) +$  SDP media bw in UL for video + $2.5\% * (\text{SDP media bw in UL for video} + \text{SDP media bw in DL for video})$ = 63 kbps	
Maximum bit rate for uplink	Equal or higher than guaranteed bit rate	
Residual BER	$10^{-5}$	16 bit CRC
SDU error ratio	$10^{-3}$	
Traffic handling priority	Subscribed traffic handling priority	Not relevant
Transfer delay	100 ms	
SDU format information	Not used	
Allocation/retention priority	Subscribed traffic handling priority	Not relevant
Source statistics descriptor	"Unknown"	

Table B.4: QoS profile for videotelephony at 38.2 kbps

In case of usage of separate PDP contexts for the speech and video streams, the speech stream QoS profile parameters are set similarly to use case 1, while the video stream QoS profile parameters are set similarly to use case 2 (but considering that the video flow is bi-directional and considering possibly the same transfer delay constraints for both media).

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at: [http://www.3gpp.org/3G\\_Specs/CRs.htm](http://www.3gpp.org/3G_Specs/CRs.htm). Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

## 7.1 Bandwidth

The bandwidth information of each media type shall be carried in SDP messages in both session and media type level during codec negotiation, session establishment and resource reallocation. [Note that for RTP based applications, 'b=AS:' gives the RTP "session bandwidth" \(including UDP/IP overhead\) as defined in section 6.2 of \[3\].](#)
