Title:	⌘ Correction of Bulk CM configuration data file XML schema namespace URIs	
Source:	⌘ S5 Nortel Networks (bonneau@nortelnetworks.com)	
Work item code:	⌘ OAM-NIM	Date: ⌘ 23/05/2003
Category:	⌘ F	Release: ⌘ Rel-5
Use <u>one</u> of the following categories: F (correction) A (corresponds to a correction in an earlier release) B (addition of feature), C (functional modification of feature) D (editorial modification) Detailed explanations of the above categories can be found in 3GPP TR 21.900 .		
Use <u>one</u> of the following releases: 2 (GSM Phase 2) R96 (Release 1996) R97 (Release 1997) R98 (Release 1998) R99 (Release 1999) Rel-4 (Release 4) Rel-5 (Release 5) Rel-6 (Release 6)		

Reason for change: ⌘ Bulk CM configuration data file XML schema namespace URIs are incorrect.

Summary of change: ⌘

- In Bulk CM configuration data file base XML schema:
 - Evolution of the version part of Bulk CM configuration data file base XML schema namespace URI definition
 - Correction of references to Generic NRM XML schema namespace URI
- In examples for Bulk CM configuration data XML files and for Bulk CM configuration data file vendor-specific XML schema:
 - Correction of references to Bulk CM configuration data file base XML schema namespace URI
 - Correction of references to Generic NRM XML schema namespace URI
 - Correction of references to UTRAN NRM XML schema namespace URI

Consequences if not approved: ⌘ Implementation of Rel-5 Bulk CM configuration data XML files would be impossible.

Change in Subclause 4.1

4.1 Global structure

The content of a configuration data XML file is the succession of:

- the standard XML declaration with specification of the version of XML and of the character encoding being used (see [2]);
- a `bulkCmConfigDataFile` XML element; this is the root XML element of configuration data XML files.

The definition of the allowed character encoding(s) is outside the scope of this document.

As defined by the following extract of XML schema `configData.xsd` (see Annex A):

```

<element name="bulkCmConfigDataFile">
  <complexType>
    <sequence>
      <element name="fileHeader">
[...]
      </element>
      <element name="configData" maxOccurs="unbounded">
[...]
      </element>
      <element name="fileFooter">
[...]
      </element>
    </sequence>
  </complexType>
</element>
```

the XML content of a `bulkCmConfigDataFile` XML element is the succession of:

- a `fileHeader` XML element (see subclause 4.2);
- one or several `configData` XML elements (see subclause 4.3);
- a `fileFooter` XML element (see subclause 4.2).

XML elements `fileHeader` and `fileFooter` are empty XML elements (see subclause 4.2).

The `bulkCmConfigDataFile` XML element shall also have all the XML attribute specifications that declare the XML namespaces (see [6]) used in the XML file.

The following XML namespaces are potentially used in configuration data XML files:

- the default XML namespace is associated with the configuration data files base XML schema `configData.xsd` (see Annex A);
- for each NRM-specific XML schema, a specific XML namespace prefix is defined for the associated XML namespace (see subclause 4.3A.1);
- XML namespaces prefixes starting with `vs`, e.g. `vSRHO11`, are reserved for the XML namespaces associated with the vendor-specific XML schemas (see clause 4.5).

Each `configData` XML element (see subclause 4.3) carries:

- NRM instances with or without their NRM attribute values in a NRM naming tree organized structure together with modifier XML attribute specification (see subclause 4.4);
- possibly vendor-specific data (see subclause 4.5).

A `configData` XML element can carry an entire tree of NRM instances with their NRM attribute values and the related vendor-specific data or any subset of it.

The following is an example of a configuration data XML file, without presentation of the XML attribute specifications and XML content of `fileHeader`, `configData` and `fileFooter` XML elements (replaced by [...]; see subclauses 4.2, 4.3, 4.4 and 4.5):

```
<?xml version="1.0" encoding="UTF-8"?>
<bulkCmConfigDataFile

  </configData>
  <configData [...]>
[...]
  </configData>
  <fileFooter [...]/>
</bulkCmConfigDataFile>
```

Change in Subclause 4.3A.2

4.3A.2 Generic mapping rules

NRM-specific XML element types are generically defined under the following mapping rules:

- to each NRM class corresponds a specific type of XML element having the following characteristics:
 - its name is the name of the NRM class;
 - it derives by extension (see [3], [4] and [5]) the `NrmClassXmlType` XML complex type defined in the XML schema `genericNrm.xsd` (see [11]);
 - it has the following XML attribute specifications, inherited from `NrmClassXmlType` XML complex type:
 - an `id` XML attribute specification; this attribute specification carries the attribute value part of the RDN of the NRM instance carried by the XML element, i.e. the value of the `naming` attribute of this NRM instance;
 - an optional `modifier` XML attribute specification (see subclause 4.4);
 - and its XML content is the succession of:
 - an optional `attributes` XML element whose XML content is the succession of:
 - zero or more specific XML elements (see below) corresponding to attributes of the NRM class, each occurring not more than once;
 - zero or more similar specific XML elements corresponding to direct subordinate NRM classes of the NRM class to which the current XML element corresponds;
- to each NRM attribute of each NRM class, except for the following NRM attributes:
 - the `naming` NRM attribute of each NRM class, whose value is already carried by the `id` XML attribute specification of the specific XML element corresponding to the NRM class;
 - the conditional `dnPrefix` NRM attribute of `SubNetwork`, `MeContext` and `ManagedElement` NRM classes (see [8]), whose value is already carried by the `dnPrefix` XML attribute specification of the `configData` XML element;

corresponds a specific type of XML element having the following characteristics:

- its name is constructed from the name of the NRM attribute by removing any contained dash character;
- and it has an XML content; this XML content carries the value of the NRM attribute.

For example for the SubNetwork NRM class (see [8]), the corresponding extract of XML schema genericNrm.xsd (see [11]) is the following:

```
<element name="SubNetwork">
<complexType>
<complexContent>
<extension base="xn:NrmClassXmlType">
<sequence>
<element name="attributes" minOccurs="0">
<complexType>
<all>
<element name="userLabel" minOccurs="0"/>
<element name="userDefinedNetworkType" minOccurs="0"/>
</all>
</complexType>
</element>
<choice minOccurs="0" maxOccurs="unbounded">
<element ref="xn:SubNetwork"/>
<element ref="xn:ManagedElement"/>
<element ref="xn:MeContext"/>
<element ref="xn:ManagementNode"/>
<element ref="xn:IRPAGroup"/>
<element ref="un:ExternalUtranCell"/>
<element ref="gn:ExternalGsmCell"/>
</choice>
</sequence>
</extension>
</complexContent>
</complexType>
</element>
```

supported by the following extract of XML schema genericNrm.xsd (see [11]):

```
<complexType name="NrmClassXmlType" abstract="true">
<attribute name="id" type="string" use="required"/>
<attribute name="modifier" use="optional">
[...]
</attribute>
</complexType>
```

Exceptions to the generic mapping rules for the definition of NRM-specific XML element types are listed by the following table:

Table 3: Generic mapping rule exceptions

Change in Subclause 4.4

4.4 XML attribute specification modifier

As defined by the following extract of XML schema genericNrm.xsd (see [11]):

```

<attribute name="modifier" use="optional">
  <simpleType>
    <restriction base="string">
      <enumeration value="create"/>
      <enumeration value="delete"/>
      <enumeration value="update"/>
    </restriction>
```

```
</simpleType>
</attribute>
```

the value of the optional **modifier** XML attribute specification of the specific XML elements corresponding to the classes of the NRM is one of the following: **create**, **delete**, or **update**.

The semantic carried by a **modifier** XML attribute specification applies only to the NRM instance corresponding to the containing XML element and not to any explicit or implicit subordinate NRM instances of this NRM instance.

The following rules apply for the **modifier** XML attribute specification:

- in upload XML configuration files, no **modifier** XML attribute specification should be present; on the contrary those are to be considered as meaningless and shall be ignored;
- in download XML configuration files:
 - if an XML element carrying an NRM instance has a **modifier** XML attribute specification of value **create**, then all directly or indirectly contained XML element carrying NRM instances, if any, shall also have a **modifier** XML attribute specification of value **create**;
 - if an XML element carrying an NRM instance has a **modifier** XML attribute specification of value **delete**, then all directly or indirectly contained XML element carrying NRM instances, if any, shall also have a **modifier** XML attribute specification of value **delete**;
 - if an XML element carrying an NRM instance has a **modifier** XML attribute specification of value **update**, then all directly contained XML element carrying NRM instances, if any, may also have a **modifier** XML attribute specification, this one being of either value **create**, **delete**, or **update**;
 - if an XML element carrying an NRM instance has no **modifier** XML attribute specification or a **modifier** XML attribute specification of value **delete**, then it shall not directly contain an **attributes** XML element.

A tree of XML elements corresponding to a tree of NRM instances with all XML elements having a **modifier** XML attribute specification of value **create** is considered to be in accordance with the following rule from Bulk CM IRP IS 3GPP TS 32.612 [1]:

"When part or a whole NRM subtree is to be created, in the configuration data file the IRPManager shall first action the create action of parents MO instances before actioning the create of any child MO instances contained in the NRM subtree i.e. create actions on MO instances shall be specified in recursive manner following the NRM hierarchy subtree from the highest MO instances to the lowest MO instances the IRPManager requires to be created."

In such a tree of NRM instances, the XML element carrying a given NRM instance does not accurately appear before XML elements carrying subordinate NRM instances. The latter XML elements rather appear as the last part of the XML content of the former XML element.

Nevertheless, XML parsing of such a tree of NRM instances can still enable the above Bulk CM IRP IS rule to be fully respected. Example of an XML parsing enabling such compliance is one effectively actioning the creation of each NRM instance when having parsed the XML start-tag of the XML element carrying the NRM instance and, if any, the contained **attributes** XML element.

A tree of XML elements corresponding to a tree of NRM instances with all XML elements having a **modifier** XML attribute specification of value **delete** is considered to be in accordance with the following rule from Bulk CM IRP IS 3GPP TS 32.612 [1]:

"When part or whole NRM subtree is to be deleted, in the configuration data file the IRPManager shall first action delete of all associated child instances contained in the NRM subtree before actioning delete of MO parents instances i.e. delete actions on MO instances shall be specified in a recursive manner following the NRM hierarchy subtree from the lowest MO instances to the highest MO instances the IRPManager requires to be deleted."

In such a tree of NRM instances, the XML elements carrying subordinate NRM instances do not appear before the XML element carrying the parent NRM instance. The former XML elements rather appear as the XML content of the latter XML element.

Nevertheless, XML parsing of such a tree of NRM instances can still enable the above Bulk CM IRP IS rule to be fully respected. Example of an XML parsing enabling such compliance is one effectively actioning the delete of each NRM instance when parsing the XML end-tag of the XML element carrying the NRM instance.

End of Change in Subclause 4.4

Change in Subclause 4.5

4.5 XML elements VsDataContainer, vsData and vsDataFormatVersion

As all XML element types corresponding to NRM classes (see subclause 4.3A.2), the VsDataContainer XML element type, explicitly declared in 3GPP TS 32.625 [11], corresponds to the VsDataContainer NRM class defined in 3GPP TS 32.622 [8].

Contained in an attributes XML element type, itself contained in a VsDataContainer XML element, as all XML element types corresponding to NRM attributes (see subclause 4.3A.2), the vsData and vsDataFormatVersion XML element types, explicitly declared in 3GPP TS 32.625 [11], correspond to the vsData and vsDataFormatVersion NRM attributes defined in 3GPP TS 32.622 [8].

As an exception to the generic mapping rules for the definition of NRM-specific XML element types (see subclause 4.3A.2), the vsData XML element type has an empty XML content.

Each vendor-specific XML schema shall declare one or more vendor-specific XML element types that:

- have a name starting with vsData, e.g. vsDataRHO;
- derive by extension (see [3], [4] and [5]) the vsData XML element type declared by the XML schema genericNrm.xsd (see [11]);
- are designated as members of the substitution group (see [3], [4] and [5]) headed by the vsData XML element type.

Beyond the above statement, the definition of vendor-specific XML schemas is outside the scope of this document.

The XML content of those vendor-specific XML elements carry vendor-specific data.

The XML content of the vsDataFormatVersion XML element shall be the filename, without the ".xsd" file extension and without any path specification, of the vendor-specific XML schema used for the related VsDataContainer XML element.

See Annex C for an example of a vendor-specific XML schema.

The following is an example of a vendor-specific XML element (in **bold**) deriving and extending the vsData XML element in a configuration data XML file:

```

Title:	⌘ Correction of GERAN NRM XML schema namespace URIs	
Source:	⌘ S5 Nortel Networks (bonneau@nortelnetworks.com)	
Work item code:	⌘ OAM-NIM	Date: ⌘ 23/05/2003
Category:	⌘ F	Release: ⌘ Rel-5
Use <u>one</u> of the following categories: F (correction) A (corresponds to a correction in an earlier release) B (addition of feature), C (functional modification of feature) D (editorial modification) Detailed explanations of the above categories can be found in 3GPP TR 21.900 .		
Use <u>one</u> of the following releases: 2 (GSM Phase 2) R96 (Release 1996) R97 (Release 1997) R98 (Release 1998) R99 (Release 1999) Rel-4 (Release 4) Rel-5 (Release 5) Rel-6 (Release 6)		

Reason for change: ⌘ GERAN NRM XML schema namespace URIs are incorrect.

Summary of change: ⌘

- Correction of GERAN NRM XML schema namespace URI definition
- Correction of references to Generic NRM XML schema namespace URI
- Correction of references to UTRAN NRM XML schema namespace URI
- Correction of references to GERAN NRM XML schema namespace URI

Consequences if not approved: ⌘ Implementation of Rel-5 Bulk CM configuration data XML files would be impossible.
