**Title: CRs TS 26.234, TS 26.244 and TS 26.245 on PSS (Release 6)**

**Document for: Approval**

**Agenda Item: 7.4.3**

The following CRs, agreed at the TSG-SA WG4 meeting #33, are presented to TSG SA #26 for approval.

Spec	CR	Rev	Phase	Subject	Cat	Vers	WG	Meeting	S4 doc
26.234	076		Rel-6	Correction of RDF schema for PSS capability vocabulary	F	6.1.0	S4	TSG-SA WG4#33	S4-040693
26.234	077		Rel-6	Transport-independent SDP bandwidth modifiers for PSS	F	6.1.0	S4	TSG-SA WG4#33	S4-040694
26.234	078		Rel-6	Correction of MIME type definition for DRM protected content	F	6.1.0	S4	TSG-SA WG4#33	S4-040695
26.234	079	1	Rel-6	Adoption of SVG Tiny 1.2 for PSS	B	6.1.0	S4	TSG-SA WG4#33	S4-040838
26.244	006	1	Rel-6	Correction of syntax of encryption boxes and outdated references	F	6.1.0	S4	TSG-SA WG4#33	S4-040858
26.244	007		Rel-6	Correction of sample structure for AMR-WB+ in 3GP files	F	6.1.0	S4	TSG-SA WG4#33	S4-040697
26.245	001	1	Rel-6	Removal of incorrect statement in Scope section of Rel-6 Timed Text	F	6.0.0	S4	TSG-SA WG4#33	S4-040848

**3GPP TSG-SA WG4 Meeting #33**  
**Helsinki, Finland, 22-26 November 2004**

**Tdoc S4-040693**

CR-Form-v7
<h2 style="margin: 0;">CHANGE REQUEST</h2>
<span style="font-size: 2em;">⌘</span> <b>26.234 CR 076</b> <span style="font-size: 2em;">⌘</span> rev <span style="font-size: 2em;">⌘</span> - <span style="font-size: 2em;">⌘</span> Current version: <b>6.1.0</b> <span style="font-size: 2em;">⌘</span>

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** | UICC apps  ME  Radio Access Network  Core Network

<b>Title:</b>	<span style="font-size: 2em;">⌘</span> Correction of RDF schema for PSS capability vocabulary		
<b>Source:</b>	<span style="font-size: 2em;">⌘</span> TSG-SA WG4		
<b>Work item code:</b>	<span style="font-size: 2em;">⌘</span> PSSrel6-Stage3	<b>Date:</b>	<span style="font-size: 2em;">⌘</span> 14/12/2004
<b>Category:</b>	<span style="font-size: 2em;">⌘</span> <b>F</b>	<b>Release:</b>	<span style="font-size: 2em;">⌘</span> Rel-6
	Use <u>one</u> of the following categories: <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP <a href="#">TR 21.900</a> .		Use <u>one</u> of the following releases: 2 (GSM Phase 2) R96 (Release 1996) R97 (Release 1997) R98 (Release 1998) R99 (Release 1999) Rel-4 (Release 4) Rel-5 (Release 5) Rel-6 (Release 6)

<b>Reason for change:</b>	<span style="font-size: 2em;">⌘</span> The RDF schema for Release 6 contains mistakes in syntax and referred name spaces. Some references in the specification are outdated (invalid).
<b>Summary of change:</b>	<span style="font-size: 2em;">⌘</span> <ul style="list-style-type: none"> <li>Corrected the RDF schema.</li> <li>Updated references.</li> <li>Corrected syntax for the reporting frequency of NADU APP packets for buffer feedback</li> <li>Some minor editorial updates.</li> </ul>
<b>Consequences if not approved:</b>	<span style="font-size: 2em;">⌘</span> The User Agent capabilities of PSS will be inconsistent and the RDF schema invalid.

<b>Clauses affected:</b>	<span style="font-size: 2em;">⌘</span> 2, 5.1, 5.2.3.2.4, 5.3.3.5, A.2.1, A.4.3, F, K.1, K.2.5										
<b>Other specs affected:</b>	<table border="1" style="display: inline-table; border-collapse: collapse; text-align: center;"> <tr> <td style="padding: 2px 5px;">Y</td> <td style="padding: 2px 5px;">N</td> </tr> <tr> <td style="padding: 2px 5px;"><input type="checkbox"/></td> <td style="padding: 2px 5px;"><input checked="" type="checkbox"/></td> </tr> <tr> <td style="padding: 2px 5px;"><input type="checkbox"/></td> <td style="padding: 2px 5px;"><input checked="" type="checkbox"/></td> </tr> <tr> <td style="padding: 2px 5px;"><input type="checkbox"/></td> <td style="padding: 2px 5px;"><input checked="" type="checkbox"/></td> </tr> </table>	Y	N	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Other core specifications	<span style="font-size: 2em;">⌘</span>

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at <http://www.3gpp.org/specs/CR.htm>. Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.

- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

---

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 5.1 Session establishment

Session establishment refers to the method by which a PSS client obtains the initial session description. The initial session description can e.g. be a presentation description, a scene description or just an URL to the content.

A PSS client shall support initial session descriptions specified in one of the following formats: SMIL, SDP, or plain RTSP URL.

In addition to `rtsp://` the PSS client shall support URLs [4] to valid initial session descriptions starting with `file://` (for locally stored files) and `http://` (for presentation descriptions or scene descriptions delivered via HTTP).

Examples for valid inputs to a PSS client are: `file://temp/morning_news.smil`, `http://mediaportal.example.com/morning_news.sdp`, and `rtsp://mediaportal.example.com/morning_news`.

URLs can be made available to a PSS client in many different ways. It is out of the scope of this specification to mandate any specific mechanism. However, an application using the 3GPP PSS shall at least support URLs of the above type, specified or selected by the user.

The preferred way would be to embed URLs to initial session descriptions within HTML or WML pages. Browser applications that support the HTTP protocol could then download the initial session description and pass the content to the PSS client for further processing. How exactly this is done is an implementation specific issue and out of the scope of this specification.

As an alternative to conventional streaming, a PSS client should also support progressive download of 3GP files [50] delivered via HTTP. A progressive-download session is established with one or more HTTP GET requests. In order to improve playback performance for 3GP files that are not authored for progressive download, a PSS client may issue (multiple pipelined) HTTP GET requests with byte ranges [17]. Example of a valid URL is `http://mediaportal/morning_news.3gp` `http://example.com/morning_news.3gp`.

Ö <cut text> Ö

#### 5.2.3.2.4 PssSmil component

Attribute name: **SmilAccept**

Attribute definition: List of content types (MIME types) that can be part of a SMIL presentation. The content types included in this attribute can be rendered in a SMIL presentation. If video/3gpp (or audio/3gpp) is included, downloaded 3GP files can be included in a SMIL presentation. Details on the 3GP file support can then be found in the ThreeGPFileFormat component. If the identifier "Streaming-Media" is included, streaming media can be included in the SMIL presentation. Details on the streaming support can then be found in the Streaming component. For each content type a set of supported parameters can be given. A content type that supports multiple parameter sets may occur several times in the list.

Component: PssSmil

Type: Literal (Bag)

Legal values: List of MIME types with related parameters and the "Streaming-Media" identifier.

Resolution rule: Append

EXAMPLE 1: 

```
<SmilAccept>
  <rdf:Bag>
    <rdf:li>image/gif</rdf:li>
    <rdf:li>image/jpeg</rdf:li>
    <rdf:li>Streaming-Media</rdf:li>
  </rdf:Bag>
</SmilAccept>
```

~~Attribute name: **SmilAccept-Subset**~~

~~Attribute definition: List of content types for which the PSS application supports a subset. MIME types can in most cases effectively be used to express variations in support for different media types. Many MIME types have several parameters that can be used for this purpose. There may exist content types for which the PSS application only supports a subset and this subset cannot be expressed with MIME-type parameters. In these cases the attribute SmilAccept-Subset is used to describe support for a subset of a specific content type. If a subset of a specific content type is declared in SmilAccept-Subset, this means that SmilAccept-Subset has precedence over SmilAccept. SmilAccept shall always include the corresponding content types for which SmilAccept-Subset specifies subsets of.~~

Attribute name: **SmilAccept-Subset**

Attribute definition: List of content types for which the PSS application supports a subset. MIME types can in most cases effectively be used to express variations in support for different media types. Many MIME types have several parameters that can be used for this purpose. There may exist content types for which the PSS application only supports a subset and this subset cannot be expressed with MIME-type parameters. In these cases the attribute SmilAccept-Subset is used

to describe support for a subset of a specific content type. If a subset of a specific content type is declared in SmilAccept-Subset, this means that SmilAccept-Subset has precedence over SmilAccept. SmilAccept shall always include the corresponding content types for which SmilAccept-Subset specifies subsets of.

The following values are defined:

- "JPEG-PSS": Only the two JPEG modes described in clause 7.5 of the present document are supported.
- "SVG-Tiny"
- "SVG-Basic"

Subset identifiers and corresponding semantics shall only be defined by the TSG responsible for the present document.

Component: PssSmil  
 Type: Literal (Bag)  
 Legal values: "JPEG-PSS", "SVG-Tiny", "SVG-Basic"  
 Resolution rule: Append

EXAMPLE 2: 

```
<SmilAccept-Subset>
  <rdf:Bag>
    <rdf:li>JPEG-PSS</rdf:li>
    <rdf:li>SVG-Tiny</rdf:li>
  </rdf:Bag>
</SmilAccept-Subset>
```

Attribute name: **SmilBaseSet**

Attribute definition: Indicates a base set of SMIL 2.0 modules that the client supports.

Component: Streaming  
 Type: Literal  
 Legal values: Pre-defined identifiers. "SMIL-3GPP-R4" and "SMIL-3GPP-R5" indicate all SMIL 2.0 modules required for scene description support according to clause 8 of Release 4 and Release 5, respectively, of TS 26.234. "SMIL-3GPP-R6" indicates all SMIL 2.0 modules required for scene-description support according to clause 8 of the present document (Release 6 of TS 26.234) and to Release 6 of TS 26.246 [52].

Resolution rule: Locked

EXAMPLE 3: 

```
<SmilBaseSet>SMIL-3GPP-R6</SmilBaseSet>
```

Attribute name: **SmilModules**

Attribute definition: This attribute defines a list of SMIL 2.0 modules supported by the client. If the SmilBaseSet is used those modules do not need to be explicitly listed here. In that case only additional module support needs to be listed.

Component: Streaming  
 Type: Literal (Bag)  
 Legal values: SMIL 2.0 module names defined in the SMIL 2.0 recommendation [31], section 2.3.3, table 2.  
 Resolution rule: Append

EXAMPLE 4: 

```
<SmilModules>
  <rdf:Bag>
    <rdf:li>BasicTransitions</rdf:li>
    <rdf:li>MultArcTiming</rdf:li>
  </rdf:Bag>
</SmilModules>
```

Ö <cut text> Ö

### 5.3.3.5 The bit-rate adaptation support attribute, "3GPP-Adaptation-Support"

To signal the support of bit-rate adaptation, a media level only SDP attribute is defined in ABNF [53]:

sdp-Adaptation-line = "a" "=" "3GPP-Adaptation-Support" ":" report-frequency CRLF

report-frequency = ~~1~~\*2NonZeroDIGIT [ DIGIT ]

NonZeroDIGIT = %x31-39 ;1-9

A server implementing rate adaptation shall signal the "3GPP-Adaptation-Support" attribute in its SDP.

A client receiving an SDP description where the SDP attribute "3GPP-Adaptation-Support" is present knows that the server provides rate adaptation. The client, if it supports bit-rate adaptation, shall then in its subsequent RTSP signalling use the "3GPP-Adaptation" header as defined in clause 5.3.2.2, as well as the RTCP NADU APP packet for reporting the next unit to be decoded, as defined in clause 6.2.3.2.

The SDP attribute shall only be present at the media level. The report frequency value, which shall be larger than zero, indicates to the client that it shall include an NADU APP packet in at least every "report-frequency" compound RTCP packet. For example, if this value is 3, the client shall send the NADU APP packet in at least every 3<sup>rd</sup> RTCP packet.

## A.2.1 General

EXAMPLE 2:

```
DESCRIBE rtsp://mediaserver.com/movie.test RTSP/1.0  
CSeq: 1  
User-Agent: TheStreamClient/1.1b2  
x-wap-profile: "http://uaprof.example.com/products/TheStreamClient1.1b2"
```

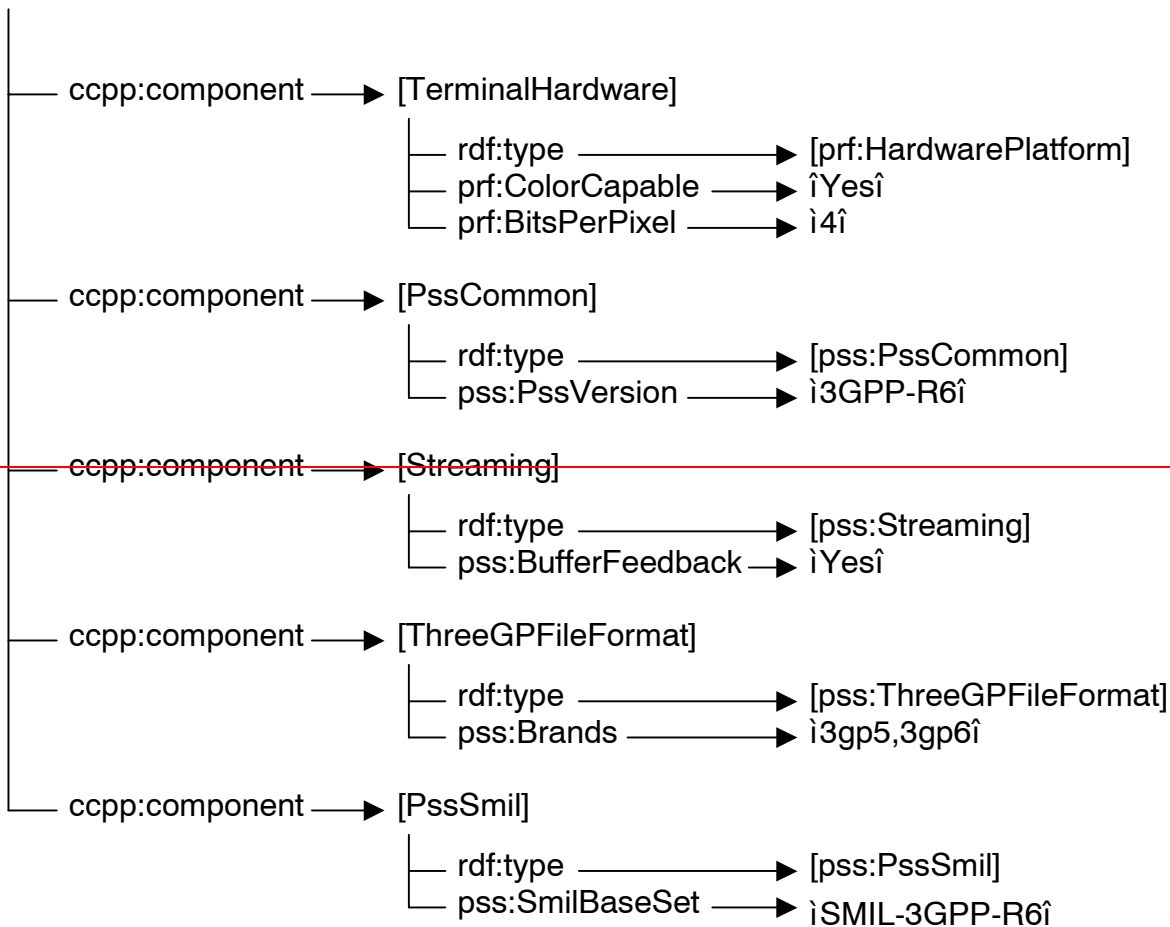

Ö <cut text> Ö

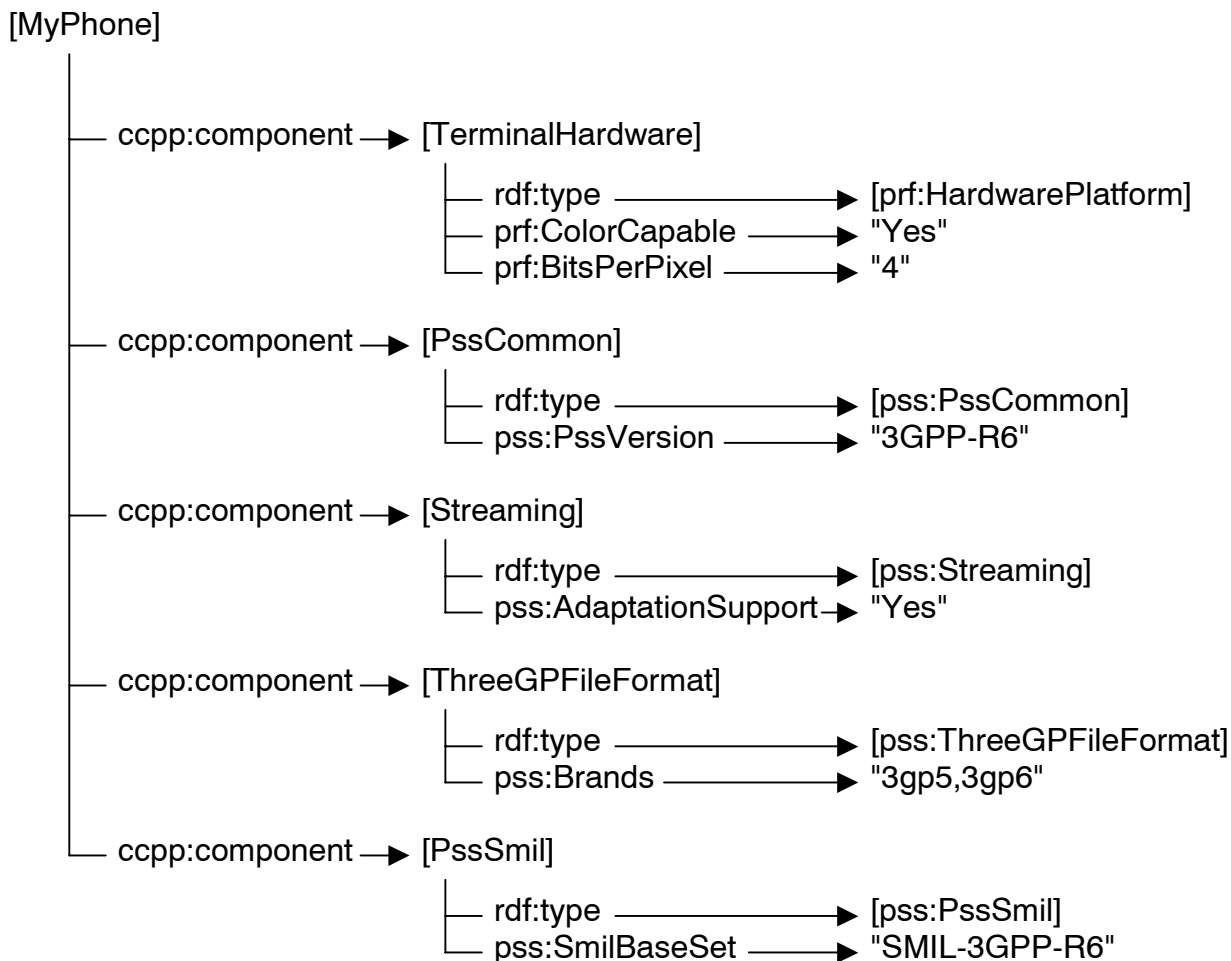

## A.4.3 The device capability profile structure

A device capability profile is a description of the capabilities of the device and possibly also the preferences of the user of that device. It can be used to guide the adaptation of content presented to the device. A device capability profile for PSS is an RDF [41] document that follows the structure of the CC/PP framework [39] and the CC/PP application UAProf [40]. The terminology of CC/PP is used in this text and therefore briefly described here.

Attributes are used for specifying the device capabilities and user preferences. A set of attribute names, permissible values and semantics constitute a CC/PP vocabulary. An RDF schema defines a vocabulary. The syntax of the attributes is defined in the schema but also, to some extent, the semantics. A profile is an instance of a schema and contains one or more attributes from the vocabulary. Attributes in a schema are divided into components distinguished by attribute characteristics. In the CC/PP specification it is anticipated that different applications will use different vocabularies. According to the CC/PP framework a hypothetical profile might look like Figure A.2. A further illustration of how a profile might look like is given in the example in clause A.4.7.

[MyPhone]

**Figure A.2: Illustration of the profile structure**

A CC/PP schema is extended through the introduction of new attribute vocabularies and a device capability profile can use attributes drawn from an arbitrary number of different vocabularies. Each vocabulary is associated with a unique XML namespace. This mechanism makes it possible to reuse attributes from other vocabularies. It should be mentioned that the prefix **ccpp** identifies elements of the CCPP namespace (URI <http://www.w3.org/2002/11/08-ccpp-ns>), **prf** identifies elements of the UAProf namespace (URI <http://www.wapforum.org/profiles/UAPROF/ccppschem-20010330>), **rdf** identifies elements of the RDF namespace (URI <http://www.w3.org/1999/02/22-rdf-syntax-ns>) and **pss** identifies elements of the PSS Release-6 namespace. (URI <http://www.3gpp.org/profiles/PSS/ccppschem-PSS6>).

Attributes of a component can be included directly or may be specified by a reference to a CC/PP default profile. Resolving a profile that includes a reference to a default profile is time-consuming. When the PSS server receives the profile from a device profile server the final attribute values can not be determined until the default profile has been requested and received. Support for defaults is required by the CC/PP specification [39]. Due to these problems, there is a recommendation made in clause 5.2.6 to not use the CC/PP defaults element in PSS device capability profile documents.

---

## Annex F (normative): RDF schema for the PSS base vocabulary

```
<?xml version="1.0"?>

<!--
  This document is the RDF Schema for Packet-switched Streaming
  Service (PSS)-specific vocabulary as defined in 3GPP TS 26.234
  Release 6 (in the following "the specification").

  The URI for unique identification of this RDF Schema is
  http://www.3gpp.org/profiles/PSS/ccppschem-PSS6

  This RDF Schema includes the same information as the respective
  chapter of the specification. Greatest care has been taken to keep
  the two documents consistence. However, in case of any divergence
  the specification takes precedence.

  All reference in this RDF Schmea are to be interpreted relative to
  the specification. This means all references using the form
  [ref] are defined in chapter 2 "References" of the specification.
  All other references refer to parts within that document.

  Note: This Schemas has been aligned in structure and base
  vocabulary to the RDF Schema used by UAProf [40].

  <rdfs:domain rdf:resource="#Streaming"/>
  <rdfs:comment>
    Description: List of content types for which the PSS application supports
    a subset. MIME types can in most cases effectively be used to express
    variations in support for different media types. Many MIME types, e.g.
    AMR-WB has several parameters that can be used for this purpose. There
    may exist content types for which the PSS application only supports a
    subset and this subset cannot be expressed with MIME-type parameters.
    In these cases the attribute StreamingAccept-Subset is used to describe
    support for a subset of a specific content type. If a subset of a specific
    content type is declared in StreamingAccept-Subset, this means that
    StreamingAccept-Subset has precedence over StreamingAccept.
    StreamingAccept shall always include the corresponding content types for
    which StreamingAccept-Subset specifies subsets of.
    No legal values are currently defined.

<rdfs:domain rdf:resource="#Streaming" />  
<rdfs:comment>  
Description: If Annex G is not supported, the attribute has no meaning. If Annex G is supported, this attribute defines the maximum initial post-decoder buffering period of video. Values are interpreted as clock ticks of a 90-kHz clock. In other words, the value is incremented by one for each 1/90 000 seconds. For example, the value 9000 corresponds to 1/10 of a second initial post-decoder buffering. Legal values are all integer values equal to or greater than zero.

Type: Number  
Resolution: Locked  
Examples: "9000"

```

</rdfs:comment>
</rdf:Description>

<rdf:Description rdf:ID="VideoPreDecoderBufferSize">
  <rdf:type rdf:resource="http://www.w3.org/2000/01/rdf-schema#Property1999/02/22-rdf-syntax-
  ns#Property"/>
  <rdfs:domain rdf:resource="#Streaming"/>
  <rdfs:comment>
    Description: This attribute signals if the optional video
    buffering requirements defined in Annex G are supported. It also
    defines the size of the hypothetical pre-decoder buffer defined in
    Annex G. A value equal to zero means that Annex G is not
    supported. A value equal to one means that Annex G is
    supported. In this case the size of the buffer is the default size
    defined in Annex G. A value equal to or greater than the default
    buffer size defined in Annex G means that Annex G is supported and
    sets the buffer size to the given number of octets. Legal values are all
    integer values equal to or greater than zero. Values greater than
    one but less than the default buffer size defined in Annex G are
    not allowed.

    Type: Number
    Resolution: Locked
    Examples: "0", "4096"
  </rdfs:comment>

## K.1 RTP payload format for encryption

This clause defines an RTP payload format for confidentiality protection for OMA DRM version 2 [74] for streamed media within PSS. The format specification addresses the following requirements:

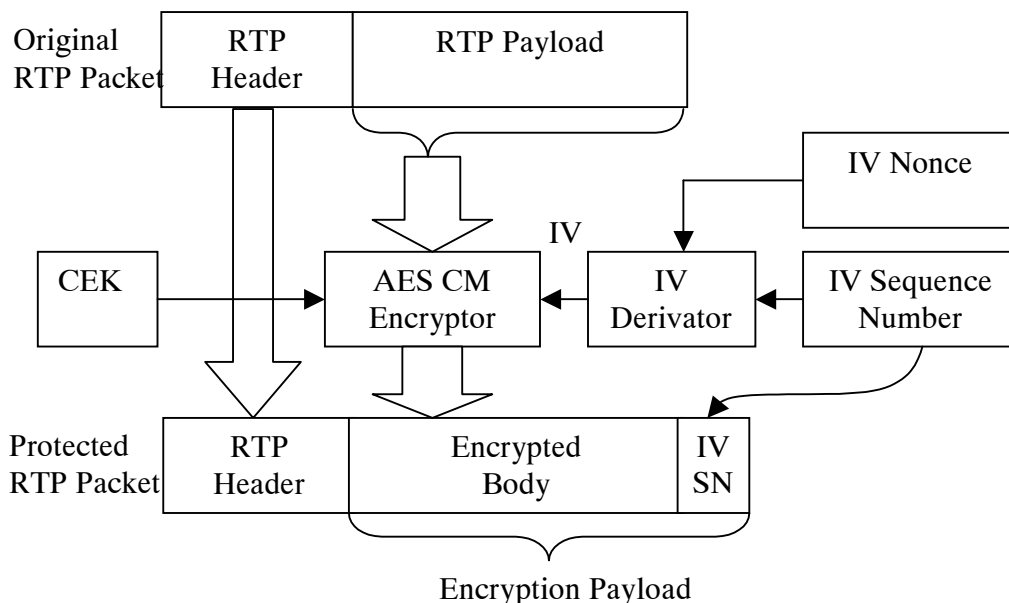

- Support random seek capabilities in the encrypted media stream;
- Support pre-encryption of RTP payloads for usage in RTP hint-tracks as present in the 3GPP file format [50];
- Support selective encryption of individual payloads;
- Support usage of a strong encryption mechanism;
- Support arbitrary media payload formats.

To fulfil the above requirements a solution based on an RTP payload format that encapsulates an original RTP payload into a new RTP payload has been developed. The complete original payload is encrypted using a crypto transform. This specification defines one crypto transform using AES [77] in counter mode with a 128-bit key. To enable pre-encryption and random seek capabilities, an explicit Initialization Vector sequence number (IVSN) is used to derive the real initialization vector (IV). A minimalistic approach is taken in regards to overhead, and therefore the RTP payload type is used to support selective encryption, provide indication of the original RTP payload and determine any protection configuration. Thus there is need for a number of parameters to be signalled in relation to any defined payload type using this format.

To be able to use any other crypto transform one will need to identify if the IVSN field is needed, or some other field(s) are needed in addition to the encrypted body, and define these. To indicate this new transform, a new MIME subtype is defined that identifies the crypto transform used. Such a crypto transform could also define the presence of key indicator fields.

The description of the RTP payload format below uses the following definitions:

Content Encryption Key (CEK):	The key used to encrypt the content, i.e. the original payloads.
Encrypted body:	The encrypted bits of an original payload.
Encryption payload format:	The RTP payload format defined in this chapter.
Encryption payload:	The RTP payload that consists of an IV sequence number, key indicator field, and an encrypted body.
Initialization Vector (IV):	The starting state of the cryptographic mode.
Original payload:	A complete RTP payload in accordance with another RTP payload format specification.
Original RTP packet:	A complete RTP packet that contains header values and payloads in accordance with the RTP specification and another RTP payload format specification.
Protected RTP packet:	An RTP packet with the encryption payload format as payload, and its header values set according to RTP and the encryption payload format.

**Figure K.1: Schematic process - from an unprotected RTP packet to a protected one**

The confidentiality protection of the original RTP payload is accomplished through the encryption of the complete payload using a crypto transform, the defined format uses AES in counter mode (AES CM) with 128-bit keys, as shown in Figure K.1. The encryption of each individual payload is made independently from each other by assigning an Initialization Vector to each payload. In order to avoid sending the complete IV (128 bits for AES CM) in each RTP packet, a derivation process is used, to create the IV for each packet. As the IV derivation is a fully defined operation, the receiver can also perform it to determine the full IV. The IV Nonce is to protect against pre-computational attacks and is signalled out of band from the RTP stream. The IV sequence number used, as input to the IV derivation, is placed in the RTP payload of the protected packet together with the resulting ciphertext.

The header fields of a protected RTP packet are populated based on the RTP header fields of the original packet. The only field that is necessary to change is the RTP payload type, which is replaced with another type indicating that the RTP payload is using the encryption payload format. Further the payload type is also used to indicate which original payload type the packet contains. This usage of the payload type avoids using any bit in the RTP payload for the signalling.

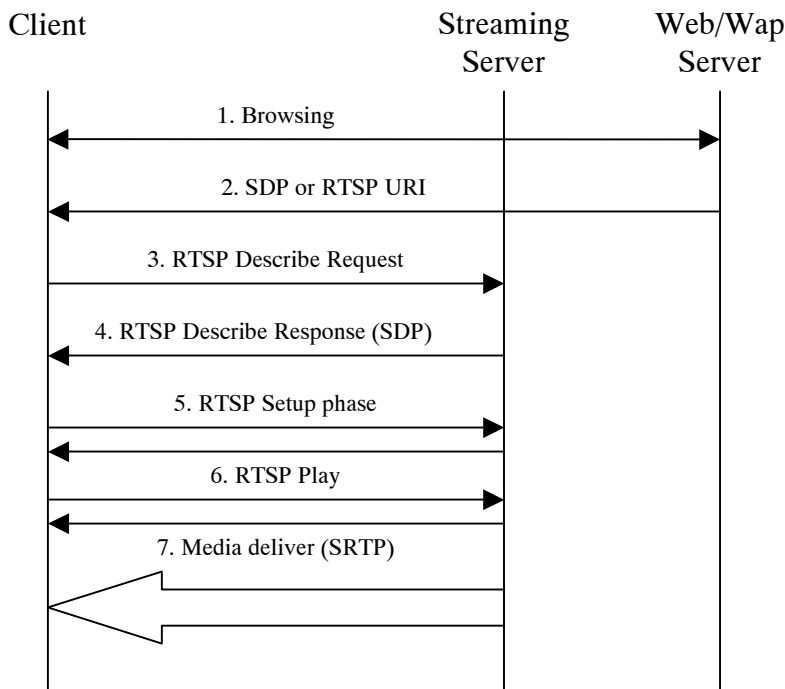

No bits in the payload format need to be spent to enable the usage of selective encryption. This is also accomplished by using the payload type of the RTP header. A sender utilizing selective encryption, (on a packet-by-packet basis) signals for each packet if it wants to send the RTP payload protected or not, by using the corresponding payload type and format. A simple de-multiplexing as shown in Figure K.2 is all that is required on the receiver side to determine which payloads that needs decryption. A signalling attribute is defined to inform the receiver when selective encryption is used.

Ö <cut text> Ö

## K.2.5 Example

This clause shows an example including the key management protocol for the content integrity protection between the streaming server and the client. First is an overview in the form of a flow diagram (see Figure K.4).

**Figure K.4: Flow diagram for Session Establishment with Integrity Protection**

1. (Optional) A user is browsing for streaming content.
2. (Optional) Upon finding interesting content the client retrieves either an RTSP URI or an SDP. If the client retrieves a SDP file, then that SDP will contain m= lines with RTP/SAVP and the integrity key management attributes. However the actual key related values will most probably not be used. See the following example:

```

v=0
o=- 950814089 950814089 IN IP4 144.132.134.67
s=Example of aggregate control of AMR speech and H.263 video with DRM with confidentiality and Integrity protection.
e=foo@bar.com
c=IN IP4 0.0.0.0
b=AS:77
t=0 0
a=range:npt=0-59.3478
a=control:rtsp://example.com/SecuredMedia/hobbs.3gp
a=3GPP-Integrity-Key: OMADRMv2:
m=audio 0 RTP/SAVP 97 98
b=AS:13
b=RR:350
b=RS:300
a=rtpmap:97 AMR/8000
a=fmtp:97 octet-align=1
a=rtpmap:98 RTP.ENC.AESCM128/8000
a=fmtp:98 opt=97; ContentID=" content1000221@ContentIssuer.com";
RightsIssuerURL="http://drm.rightsserver.org/1000221"; IVnonce=JDE0SYJCAAqWUwWJiBM=;
SelectiveEncryption=1
    
```

```

a=control:rtsp://example.com/SecuredMedia/hobbs.3gp/streamID=0
a=3GPP-Adaptation-Support:2
m=video 0 RTP/SAVP 99 100
b=AS:64
b=RR:2000
b=RS:1200
a=rtpmap:99 H263-2000/90000
a=fmtp:99 profile=3;level=10
a=rtpmap:100 RTP.ENC.AESCM128/90000
a=fmtp:100 opt=99; ContentID="content6188164@ContentIssuer.com"; RightsIssuerURL="
http://drm.rightsserver.org/6188164"; IVnonce= IwOSRWeSAUiVEiN5gVA=
a=control:rtsp://example.com/SecuredMedia/hobbs.3gp/streamID=1
a=3GPP-Adaptation-Support:1

```

The client upon receiving this SDP can determine the need to support SRTP for this media (signalled by the SAVP profile). Also the key management scheme is evident, through the SDP attribute a=3GPP-Integrity-Key and its method identifier. The a=3GPP-Integrity-Key not containing key and freshness token also tells the client that it needs to request a new SDP containing session specific values.

3. The client may now know (due to the SDP) that it needs to retrieve a SDP from the streaming server. Therefore it sends an RTSP DESCRIBE request to the server including a freshness token.

```

DESCRIBE rtsp://mediaserver.com/movie.test RTSP/1.0
CSeq: 1
User-Agent: TheStreamClient/1.1b2
x-wap-profile: "http://uaprof.example.com/products/TheStreamClient1.1b2"
3GPP-Freshness-Token: zSARrvlKl94OcWB/yqDszw==

```

4. The server has received a DESCRIBE request for content that shall be integrity protected. If the server is delivering content from a 3GP file, the server determines this based on the SRTP hint-tracks present in the file, and its schemeTypeBox. If this indicates that the key management to be used is the one specified above. The server generates the *i\_nonce* values, and derives the keys *Ks* and *Km*. The server specifies the SRTP security parameters within the SDP, adding the *i\_nonce* values, the encrypted copy of *k*, and the freshness token, and integrity protects such SDP part with the derived key *Ks*. This results in a new SDP looking like this:

```

v=0
o=- 950814089 950814089 IN IP4 144.132.134.67
s=Example of aggregate control of AMR speech and H.263 video with DRM with confidentiality and Integrity protection.

a=control:rtsp://example.com/session0000012838984/m1
a=3GPP-Adaptation-Support:2
a=3GPP-SRTP-Config:3NivNiiwMNgZmngs128OcA== NRknve/o/LXY97cRY7Y= auth-tag-len=32
m=video 0 RTP/SAVP 99 100

```

```
b=AS:64
b=RR:2000
b=RS:1200
a=rtpmap:99 H263-2000/90000
a=fmtp:99 profile=3;level=10
a=rtpmap:100 RTP.ENC.AESCM128/90000
a=fmtp:100 opt=99; ContentID="content6188164@ContentIssuer.com"; RightsIssuerURL="
http://drm.rightserver.org/6188164"; IVnonce= IwOSRWeSAUiVEiN5gVA=
a=control:rtsp://example.com/session0000012838984/m2
a=3GPP-Adaptation-Support:1
a=3GPP-SRTP-Config:PyChokXYVigC9kDftofE7Q== 0zvrijkBK/9Yc3BJ61/Q= auth-tag-len=80
```

This SDP is then transmitted to the client.

5. The client decrypts  $k$ , derives the keys  $K_s$  and  $K_m$ , and verifies the integrity of the SDP part. The freshness token's validity needs also to be checked. If successful, the client populates the SRTP crypto contexts using the supplied keys and parameters. The client uses RTSP to setup both media streams in an aggregated session at server. This is done using the new control URI supplied in the SDP, which allows the server to determine which of its generated contexts shall be used for this session.
6. The client requests to start media deliver through a RTSP PLAY request. The server responds.
7. The server delivers a stream of SRTP packets that are integrity protected (as well as pre-encrypted, in accordance to section K.1).

## Annex L (informative): Change history

CR-Form-v7

## CHANGE REQUEST

26.234 **CR 077** rev - Current version: 6.1.0

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ☞ symbols.

**Proposed change affects:** | UICC apps  ME  Radio Access Network  Core Network

<b>Title:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> Transport-independent SDP bandwidth modifiers for PSS		
<b>Source:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> TSG-SA WG4		
<b>Work item code:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> PSSrel6-Stage3	<b>Date:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> 14/12/2004
<b>Category:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> <b>F</b>	<b>Release:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> Rel-6
	Use <u>one</u> of the following categories:		Use <u>one</u> of the following releases:
	<b>F</b> (correction)		2 (GSM Phase 2)
	<b>A</b> (corresponds to a correction in an earlier release)		R96 (Release 1996)
	<b>B</b> (addition of feature),		R97 (Release 1997)
	<b>C</b> (functional modification of feature)		R98 (Release 1998)
	<b>D</b> (editorial modification)		R99 (Release 1999)
	Detailed explanations of the above categories can be found in 3GPP <a href="#">TR 21.900</a> .		Rel-4 (Release 4)
			Rel-5 (Release 5)
			Rel-6 (Release 6)

<b>Reason for change:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> These changes to TS 26.234 were proposed in S4-040421 and agreed at SA4#32 (PSM report S4-040600). By mistake, the corresponding CR was never produced. The changes solve the issue with expressing media and session bandwidth values in SDP. The current usage of only using the SDP bandwidth modifier "AS" prevents a single value from being used over different IP protocols, as the overhead differs between IPv4 and IPv6.
<b>Summary of change:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> The agreed SDP bandwidth modifier TIAS is added and usage rules are clarified.
<b>Consequences if not approved:</b>	<span style="border: 1px solid black; padding: 2px;">☞</span> PSS Streaming session bandwidth requirements cannot be correctly represented with a single value if different IP versions or usage of header compression occur.

### How to create CRs using this form:

Comprehensive information and tips about how to create CRs can be found at <http://www.3gpp.org/specs/CR.htm>. Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ☞ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be

downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.

- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

---

## 2 References

Ö <cut text> Ö

### 5.3.3 SDP

#### 5.3.3.1 General

RTSP requires a presentation description. SDP shall be used as the format of the presentation description for both PSS clients and servers. PSS servers shall provide and clients interpret the SDP syntax according to the SDP specification [6] and appendix C of [5]. The SDP delivered to the PSS client shall declare the media types to be used in the session using a codec specific MIME media type for each media. MIME media types to be used in the SDP file are described in clause 5.4 of the present document.

The SDP [6] specification requires certain fields to always be included in an SDP file. Apart from this a PSS server shall always include the following fields in the SDP:

- "a=control:" according to clauses C.1.1, C.2 and C.3 in [5];
- "a=range:" according to clause C.1.5 in [5];
- "a=rtpmap:" according to clause 6 in [6];
- "a=fmtp:" according to clause 6 in [6].

When an SDP document is generated for media stored in a 3GP file, each control URL defined at the media-level `a=control:` field shall include a stream identifier in the last segment of the path component of the URL. The value of the stream id shall be defined by the track-ID field in the track header (tkhd) box associated with the media track.

When a PSS server receives a set-up request for a stream, it shall use the stream identifier specified in the URL to map the request to a media track with a matching track-ID field in the 3GP file. Stream identifiers shall be expressed using the following syntax:

```
streamIdentifier = <stream_id_token>="<stream_id>
```

```
stream_id_token = 1*alpha
```

```
stream_id = 1*digit
```

The bandwidth field in SDP is needed by the client in order to properly set up QoS parameters. Therefore, a PSS server shall include the `b=AS:` and `"b=TIAS:"` and `"a=maxprate"` [93] fields at the media level for each media stream in SDP, and should include `"b=TIAS"` and `"a=maxprate"` at session level, and a PSS client shall interpret these fields. If both bandwidth modifiers are present, "b=TIAS" should be used, however it may be missing in content produced according to earlier releases. When a PSS client receives SDP, it should ignore the session level `b=AS:` parameter (if

present), and instead calculate session bandwidth from the media level bandwidth values of the relevant streams. If "b=TIAS" and "a=maxprate" is present at session level, it should be used in preference over the media level values, as session level can provide a more accurate description of the needed session bandwidth when aggregating several media streams together. -A PSS client shall also handle the case where the bandwidth parameters is are not present, since this may occur when connecting to a Release-4 server.

Note that for RTP based applications, b=AS:i gives the RTP "session bandwidth" (including UDP/IP overhead) as defined in section 6.2 of [9].

The bandwidth for RTCP traffic shall be described using the "RS" and "RR" SDP bandwidth modifiers, as specified by [55]. The "RS" SDP bandwidth modifier indicates the RTCP bandwidth allocated to the sender (i.e. PSS server) and "RR" indicates the RTCP bandwidth allocated to the receiver (i.e. PSS client). A PSS server shall include the "b=RS:" and "b=RR:" fields at the media level for each media stream in SDP, and a PSS client shall interpret them. A PSS client shall also handle the case where the bandwidth modifier is not present according to section 3 of [55], since this may occur when connecting to a Release-4 server.

There shall be a limit on the allowed RTCP bandwidth for senders and receivers in a session. This limit is defined as follows:

- 4000 bps for the RS field (at media level);
- 5000 bps for the RR field (at media level).

The default value for each of the "RS" and "RR" SDP bandwidth modifiers is 2.5% of the bandwidth given by the b=ASi parameter at media level.

In Annex A.2.1 an example SDP in which the limit for the total RTCP bandwidth is 5% of the session bandwidth is presented.

The media which has an SDP description that include an open ended range (format=startvalue-) in any time format in the SDP attribute "a=range", e.g. "a=range: npt=now-", or "a=range: clock=20030825T152300Z-", shall be considered media of unknown length. Such a media shall be considered as non-seekable, unless other attributes override this property.

The "t=", "r=", and "z=" SDP parameters are used to indicate when the described session is active. It can be used for users to filter out obsolete SDP files. When creating an SDP for a streaming session, one should try to come up with the most accurate estimate of time that the session is active. The "t=", "r=", and "z=" SDP parameters are used for this purpose, i.e., to indicate when the described session is active. If the time at which a session is active is known to be only for a limited period, the "t=", "r=", and "z=" attributes should be filled out appropriately (the "t=" should contain non-zero values, possibly using the "r=" and "z=" parameters). If the stop-time is set to zero, the session is not bounded, though it will not become active until after the start-time. If the start-time is also zero, the session is regarded as permanent. A session should only be marked as permanent ("t=0 0") if the session is going to be available for a significantly long period of time or if the start and stop times are not known at the time of SDP file creation. Recommendations for what is considered a significant time is present in the SDP specification [6].

IPv6 addresses in SDP descriptions shall be supported according to RFC 3266[49].

NOTE: The SDP parsers and/or interpreters shall be able to accept NULL values in the 'c=' field (e.g. 0.0.0.0 in IPv4 case). This may happen when the media content does not have a fixed destination address. For more details, see Section C.1.7 of [5] and Section 6 of [6].

### How to create CRs using this form:

Comprehensive information and tips about how to create CRs can be found at <http://www.3gpp.org/specs/CR.htm>. Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/>. For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.

- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

## K.1.4 Signalling

This clause specifies the RTP payload format MIME type, and how it is utilized in SDP. An example is included as well.

Any unknown MIME parameter shall be ignored.

### K.1.4.1 MIME type definition

MIME media type name: audio, video, text, ~~application, image~~

MIME subtype name: rtp-~~enc-~~aescm128

Required parameters:

- |                         |                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>opt:</b>             | The payload type number of the payload type contained in the encrypted payload. An integer value between 0-127.                                                   |
| <b>rate:</b>            | The timestamp rate of this payload type, which shall be the same as that of the original payload type. This is an integer value between 1 and $2^{32}$ .          |
| <b>ContentID:</b>       | The OMA DRM content ID [75] used to identify the content when establishing a crypto context. The value is an RFC 2396 [60] URI, which shall be quoted using "<">. |
| <b>RightsIssuerURL:</b> | The right issuer URL as defined by OMA DRM [75]. The value is an URI in accordance with RFC 2396 [60], which shall be quoted using "<">.                          |
| <b>IVnonce:</b>         | The value of this parameter is the nonce that forms the IV as specified by the crypto transform, encoded using Base 64 [69].                                      |

Optional parameters:

- |                             |                                                                                                                                                                                                                                              |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SelectiveEncryption:</b> | Indicates if this stream is selectively encrypted. Allowed values are 0 (false) and 1 (true). If not present, selective encryption shall not be used. Please note that unless this indicator is integrity protected, it fulfills no purpose. |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Encoding considerations:

This type is only defined for transfer via RTP (RFC 3550).

Security considerations:

See considerations raised in RTP RFC 3550 [9] and any applicable profile like RFC 3551 [10] or RFC 3711 [72]. Further see 3GPP TS 26.234, Release 6, Annex K for comments on security issues. The main issues that exists are:

- This RTP payload format only confidentiality protects the RTP payload, thus header information is leaked, similarly to SRTP.
- The use of stream ciphers as AES CM and no integrity protection allows an attacker to purposefully attack the content of the encrypted RTP payload by switching individual bits.
- The usage of selective encryption without integrity protection allows for an attacker to perform any replacements of complete RTP payloads and packets it desires.
- The payload format makes the receiver vulnerable to denial of service attacks that inserts RTP packets into the stream, that the receiver then interprets as being encrypted thus wasting computational resources. To prevent this attack, authentication needs to be used.

Interoperability considerations:

**Published specification:**

3GPP TS 26.234, Release 6.

Open Mobile Alliance DRM Content Format V2.0

**Applications which use this media type:**

Third Generation Partnership Project (3GPP) Packet-switched Streaming Service (PSS) clients and servers, which supports the Open Mobile Alliance's specification of Digital Rights Management version 2.0.

**Additional information:**

Magic number(s): N/A

File extension(s): N/A

Macintosh File Type Code(s): N/A

**Person & email address to contact for further information:**

magnus.westerlund@ericsson.com

**Intended usage:**

Common

**Author/Change controller:**

3GPP TSG SA

## K.1.4.2 Mapping of MIME to SDP

The MIME media types for the encrypted RTP payload format and its parameter strings are mapped to fields in the Session Description Protocol (SDP) [6] as follows:

- The media name in the "m=" line of SDP shall be set to the used media type, i.e. audio, video, text, application, or image.
- The encoding name in the "a=rtpmap" line of SDP shall be `rtp-enc-aescm128` (the MIME subtype).
- The clock rate in the "a=rtpmap" line shall be equal to the rate parameter.
- The remaining parameters when present, shall be included in the "a=fmtp" line of SDP. These parameters are expressed as a MIME media type string, in the form of a semicolon separated list of parameter=value pairs.

Note that the payload format (encoding) names are commonly shown in upper case. MIME subtypes are commonly shown in lower case. These names are case-insensitive in both places. Similarly, parameter names are case-insensitive both in MIME types and in the default mapping to the SDP a=fmtp attribute.

This MIME type is only intended for declarative usage, like in RTSP. The usage and behaviour in the SDP Offer/Answer model is undefined.

### K.1.4.3 SDP example

### K.2.5 Example

This clause shows an example including the key management protocol for the content integrity protection between the streaming server and the client. First is an overview in the form of a flow diagram (see Figure K.4).

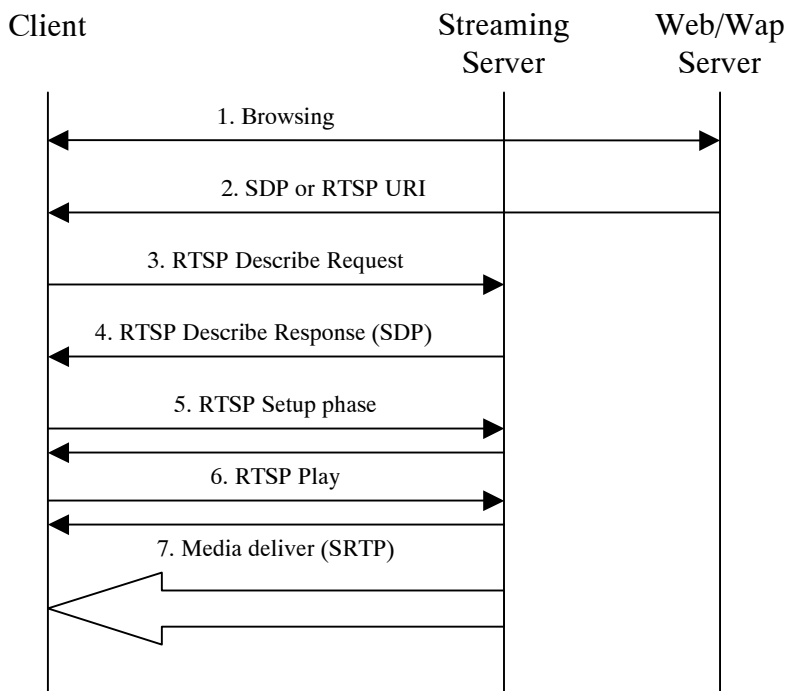

Figure K.4: Flow diagram for Session Establishment with Integrity Protection

1. (Optional) A user is browsing for streaming content.
2. (Optional) Upon finding interesting content the client retrieves either an RTSP URI or an SDP. If the client retrieves a SDP file, then that SDP will contain m= lines with RTP/SAVP and the integrity key management attributes. However the actual key related values will most probably not be used. See the following example:

```

v=0
o=- 950814089 950814089 IN IP4 144.132.134.67
s=Example of aggregate control of AMR speech and H.263 video with DRM with confidentiality and Integrity protection.
  
```

```

e=foo@bar.com
c=IN IP4 0.0.0.0
b=AS:77
t=0 0
a=range:npt=0-59.3478
a=control:rtsp://example.com/SecuredMedia/hobbs.3gp
a=3GPP-Integrity-Key: OMADRMv2:
m=audio 0 RTP/SAVP 97 98
b=AS:13
b=RR:350
b=RS:300
a=rtptime:97 AMR/8000
a=fmtp:97 octet-align=1
a=rtptime:98 RTP-ENC-AESCM128RTP-ENC-AESCM128/8000
a=fmtp:98 opt=97; ContentID="content1000221@ContentIssuer.com";
RightsIssuerURL="http://drm.rightsserver.org/1000221"; IVnonce=JDE0SYJCAaQWUwWJiBM=;
SelectiveEncryption=1
a=control:rtsp://example.com/SecuredMedia/hobbs.3gp/streamID=0
a=3GPP-Adaptation-Support:2
m=video 0 RTP/SAVP 99 100
b=AS:64
b=RR:2000
b=RS:1200
a=rtptime:99 H263-2000/90000
a=fmtp:99 profile=3;level=10
a=rtptime:100 RTP-ENC-AESCM128RTP-ENC-AESCM128/90000
a=fmtp:100 opt=99; ContentID="content6188164@ContentIssuer.com"; RightsIssuerURL="
http://drm.rightsserver.org/6188164"; IVnonce=IwOSRWeSAUiVEiN5gVA=
a=control:rtsp://example.com/SecuredMedia/hobbs.3gp/streamID=1
a=3GPP-Adaptation-Support:1

```

The client upon receiving this SDP can determine the need to support SRTP for this media (signalled by the SAVP profile). Also the key management scheme is evident, through the SDP attribute a=3GPP-Integrity-Key and its method identifier. The a=3GPP-Integrity-Key not containing key and freshness token also tells the client that it needs to request a new SDP containing session specific values.

3. The client may now know (due to the SDP) that it needs to retrieve a SDP from the streaming server. Therefore it sends an RTSP DESCRIBE request to the server including a freshness token.

```
DESCRIBE rtsp://mediaserver.com/movie.test RTSP/1.0
```

```
CSeq: 1
```

```
User-Agent: TheStreamClient/1.1b2
```

```
x-wap-profile: http://uaprof.example.com/products/TheStreamClient1.1b2
```

```
3GPP-Freshness-Token: zSARrvlKL94OcWB/yqDszw==
```

4. The server has received a DESCRIBE request for content that shall be integrity protected. If the server is delivering content from a 3GP file, the server determines this based on the SRTP hint-tracks present in the file, and its schemeTypeBox. If this indicates that the key management to be used is the one specified above. The server generates the i\_nonce values, and derives the keys Ks and Km. The server specifies the SRTP security parameters within the SDP, adding the i\_nonce values, the encrypted copy of k, and the freshness token, and integrity protects such SDP part with the derived key Ks. This results in a new SDP looking like this:

```

v=0
o=- 950814089 950814089 IN IP4 144.132.134.67
s=Example of aggregate control of AMR speech and H.263 video with DRM with confidentiality and Integrity

```

This SDP is then transmitted to the client.

5. The client decrypts  $k$ , derives the keys  $K_s$  and  $K_m$ , and verifies the integrity of the SDP part. The freshness token's validity needs also to be checked. If successful, the client populates the SRTP crypto contexts using the supplied keys and parameters. The client uses RTSP to setup both media streams in an aggregated session at server. This is done using the new control URI supplied in the SDP, which allows the server to determine which of its generated contexts shall be used for this session.
6. The client requests to start media deliver through a RTSP PLAY request. The server responds.
7. The server delivers a stream of SRTP packets that are integrity protected (as well as pre-encrypted, in accordance to section K.1).

## CHANGE REQUEST

⌘ **26.234 CR 079** ⌘ rev **1** ⌘ Current version: **6.1.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** | UICC apps  ME  Radio Access Network  Core Network

<b>Title:</b>	⌘ Adoption of SVG Tiny 1.2 for PSS		
<b>Source:</b>	⌘ TSG SA WG4		
<b>Work item code:</b>	⌘ PSSrel6-Stage3	<b>Date:</b>	⌘ 14/12/2004
<b>Category:</b>	⌘ <b>B</b>	<b>Release:</b>	⌘ Rel-6
	Use <u>one</u> of the following categories: <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP <a href="#">TR 21.900</a> .		Use <u>one</u> of the following releases: 2 (GSM Phase 2) R96 (Release 1996) R97 (Release 1997) R98 (Release 1998) R99 (Release 1999) Rel-4 (Release 4) Rel-5 (Release 5) Rel-6 (Release 6)

<b>Reason for change:</b>	⌘ Addition of Scalable Vector Graphics (SVG) Tiny 1.2 to PSS		
<b>Summary of change:</b>	⌘ SVG Tiny 1.2 added as a supported format together with content creation guidelines in an informative annex. ECMAScript added as a scripting language.		
<b>Consequences if not approved:</b>	⌘ PSS in Release 6 will not be capable of SVG Tiny 1.2.		

<b>Clauses affected:</b>	⌘ 2, 7.7, L										
<b>Other specs affected:</b>	<table border="1" style="display: inline-table; border-collapse: collapse;"> <tr> <td style="text-align: center;">Y</td> <td style="text-align: center;">N</td> </tr> <tr> <td style="text-align: center;">X</td> <td style="text-align: center;"></td> </tr> <tr> <td style="text-align: center;"></td> <td style="text-align: center;">X</td> </tr> <tr> <td style="text-align: center;"></td> <td style="text-align: center;">X</td> </tr> </table> Other core specifications Test specifications O&M Specifications	Y	N	X			X		X	⌘ TS 26.140 (see below)	
Y	N										
X											
	X										
	X										
<b>Other comments:</b>	⌘ SVG Tiny 1.2 is added to MMS in CR 26.140 010, which refers to the content creation guidelines provided by this CR.										

### How to create CRs using this form:

Comprehensive information and tips about how to create CRs can be found at <http://www.3gpp.org/specs/CR.htm>. Below is a brief summary:

- 1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/>. For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.

- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

---

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 7.7 Vector graphics

If vector graphics is supported, ~~the SVG Tiny 1.2 profile [42] [43] and ECMAScript [93]~~ shall be supported. ~~In addition SVG Basic profile [42] [43] may be supported.~~

NOTE 1: The compression format for SVG content is GZIP [59], in accordance with the SVG specification [42].

NOTE 2 Only codecs and MIME media types supported by PSS, as specified in clause 7 and in subclause 5.4, respectively, shall be used. PSS clients do not support the Ogg Vorbis format.

~~NOTE 3: Adoption of SVG Tiny 1.2 to Release 6 is still being considered (as a working assumption) to PSS. Decision will be made as a late Release 6 item during TSG SA Meeting #26. Content creators of SVG Tiny 1.2 are strongly recommended to follow the content creation guidelines provided in Annex L.~~

NOTE 4: If SVG Tiny 1.2 will not be published within a reasonable timeframe, the decision to adopt SVG Tiny 1.2 in favour of SVG Tiny 1.1 may be reconsidered.

Ö <cut text> Ö

# Annex L (informative): SVG Tiny 1.2 content creation guidelines

## L.1 Feature analysis

This clause provides an analysis of SVG Tiny 1.2 features in Table L.1.

**Table L.1: Feature analysis of SVG Tiny 1.2**

<u>Element / feature</u>	<u>Status</u>	<u>Comment</u>
<u>animate*</u>	<u>Should be used with caution.</u>	<u>In conjunction with other expensive features, which are OK for static scenes, animation may yield scenes with insufficient performance.</u>
<u>Animation</u>	<u>(=embedded image support) To be used sparingly.</u>	<u>High potential for performance hit, should be used with caution.</u>
<u>audio</u>	<u>No constraint</u>	
<u>desc / title / metadata</u>	<u>No constraint</u>	
<u>flow text</u>	<u>Should not be animated continuously.</u>	
<u>SVG fonts</u>	<u>Should be used sparingly.</u>	<u>Use of SVG fonts may lead to poor readability, in which case device font support should be preferred. Also, SVG fonts increase the size of content and thus download times.</u>
<u>foreignObject</u>	<u>No constraint</u>	<u>May be safely ignored by SVG Tiny implementations.</u>
<u>a / g / defs</u>	<u>No constraint</u>	
<u>handler</u>	<u>Should be used sparingly.</u>	
<u>image</u>	<u>Animation of scale and rotation should be used sparingly.</u>	<u>Animation of scale and rotation of an image has a similar CPU requirement than transformed video rendering, and as such should be avoided on most devices.</u>
<u>linearGradient / radialGradient / stop</u>	<u>Should be used sparingly.</u>	<u>This may lead to a significant performance hit on lower/middle-end devices.</u>
<u>complex stroking and transparency</u>	<u>Should be used sparingly.</u>	<u>The screen surface used by transparent objects should be small. Full screen fade-in, fade-out (by simply animating fill-opacity and opacity on images) or cross-fade should be avoided on most devices. Use of complex stroking will incur a significant performance hit.</u>
<u>page / pageSet</u>	<u>No constraint</u>	<u>Specification problems may lead to usability problems.</u>
<u>&lt;all shapes&gt;</u>	<u>No constraint</u>	
<u>prefetch</u>	<u>No constraint</u>	
<u>script</u>	<u>No constraint</u>	
<u>set</u>	<u>No constraint</u>	
<u>solidColor</u>	<u>No constraint</u>	
<u>svg</u>	<u>No constraint</u>	
<u>switch</u>	<u>No constraint</u>	
<u>text / tspan</u>	<u>No constraint</u>	
<u>use</u>	<u>(=embedded image support). To be used sparingly.</u>	<u>High potential for performance hit, should be used with caution.</u>
<u>video</u>	<u>Video could be used with media-handling=ipinned Scaling = 1,1 / Rotation (none/0°) SVG could provide a handling=media rotation for translation, rotation by 90° multiples or scaling. In any case no animation of the transformation.</u>	<u>On devices without hardware acceleration, frame-by-frame scaling, rotation and re-sampling of video is not achievable. Overlaying graphics on video content is considered a very expensive operation and may have significant consequences, such as lack of synchronization and degraded output quality.  The video rendering features are highly dependent on the host capabilities and one may expect potential differences between implementations. Content creators should be very cautious when dealing with such functionality.</u>

## L.2 Recommendations

### L.2.1 General

This clause provides detailed recommendations for the usage of SVG Tiny 1.2 features.

### L.2.2 Video element

#### L.2.2.1 Inclusion of the video element in SVG content

The video element should be included within a "switch" element. The feature string for video could be

1. <http://www.w3.org/TR/SVG12/feature#3GPPTransformedVideo>
2. the feature string for video is <http://www.w3.org/TR/SVG12/feature#3GPPVideo>
3. or the alternate representation of a "video" element could be an image.

EXAMPLE:

```
<q transform="translate(10,0);scale(1.5)">
<switch>
<video
  xlink:href="video.3gp"
  type="video/H263-2000"
  requiredFeatures="http://www.w3.org/TR/SVG12/feature#3GPPTransformedVideo" />
<video
  xlink:href="video.3gp"
  type="video/H263-2000"
  requiredFeatures="http://www.w3.org/TR/SVG12/feature#3GPPVideo"
  media-handling="pinned" />
<image xlink:ref="image.jpg" width="176" height="144">
</switch>
</q>
```

The above example shows a transformed video. If the PSS client supports "3GPPTransformedVideo", i.e. transformations with only translation and scaling, the video shall be transformed, if not, a video-enabled PSS client shall display the video without scaling and rotation ("pinned"). Finally, an image shall be displayed if neither one of the above cases is possible at the PSS client.

#### L.2.2.2 Transformation of video

SVG Tiny 1.2 supports the video element and proper rendering requires video to be subject to transformation just like any other graphics object. This implies that any arbitrary transform can be applied to embedded video content. Dynamic transformation of video content is an expensive operation and therefore would largely (and negatively) impact the frame rate of animated SVG content. This feature is also known to be very complex to be supported among most of the current mobile devices.

SVG Tiny 1.2 does not require transform video. As a consequence transform video is optional. When optionally applied to video elements, the following transformations and the animations thereof are applicable in increasing complexity order:

1. Translation of the video element shall be applied.
2. Rotation of video by 90°-90°degrees is permitted.
3. Scaling of the video element is permitted.

NOTE: PSS clients may decide not to apply scaling through the media handling attribute.

Dynamic transformation of video content should be avoided. Overlaying graphics on video content is considered a very expensive operation and may have significant consequences, such as lack of synchronization and degraded output quality.

The video rendering features are highly dependent on the host capabilities and one may expect potential differences between implementations. Content creators should be very cautious when dealing with such functionality.

## L.2.3 Embedded image support

PSS clients shall support the rendering of raster images referenced by the `<image>` element.

Recommendation: Content creators should be cautious when using this feature due to the potential negative performance impact.

NOTE: This feature requires maintaining multiple DOM trees between the referenced and the root or main SVG image. It can potentially lead to memory and performance issues with additional requirements, such as extra data validation/parsing and maintaining multiple buffers/contexts

## L.2.4 Handler element

Recommendation: Content creators should be cautious when using this feature due to the potential negative performance impact.

NOTE: SVG Tiny 1.2 adds support for the new `<handler>` element that allows event handling to be processed in a compiled language. This feature brings extra complexity to script management. For example, it requires internal access from the SVG engine to other engines such as Java Virtual Machine. Scripting (i.e. `<script>` element) is sufficient and reasonable for all the use cases.

## L.2.5 Transparency, stroking and gradients

SVG Tiny 1.2 supports fill-opacity and stroke-opacity, complex stroking and gradients. Using transparency basically makes the rendering of the current object 3 times slower. No animation of gradients or animation of a small part of the screen only is recommended. No animation of shapes with stroking is recommended. Transparency on a small surface of the screen is recommended.

Recommendation: Content creators should be cautious when using these features due to the potential negative performance impact by restricting their use to small surfaces and/or refraining from animating them.

## L.2.6 Events

SVG Tiny 1.2 supports the following events: `mousemove`, `mouseover`, `mouseout`, `mousedown`, `mouseup`, `click`, `DOMActivate`, `DOMFocusIn`, `DOMFocusOut`, `SVGLoad`, `SVGScroll`, `SVGResize`, `SVGZoom`, `beginEvent`, `endEvent`, `repeat`, Text events.

Recommendation: Content creators should be aware that some events are not universally available on all platforms, and consequently they should not rely on the use of the following events: `mousemove`, `mouseover`, `mouseout`, `mousedown`, `mouseup`, `click`.

## L.2.7 Flowing text

SVG Tiny 1.2 enables a block of text and graphics to be rendered inside a single flowregion of rectangle shape, while automatically wrapping the objects into lines, using the `flowRoot` element. This feature introduces four new elements `<flowRoot>`, `<flowRegion>`, `<flowPara>`, `<flowSpan>` with some restrictions.

Recommendation: Content creators should be cautious when using this feature due to the potential negative performance impact and refrain from continuous animation of the flow region.

## L.2.8 SVG fonts

SVG Tiny 1.2 supports the definition and use of SVG fonts for rendering text. The lack of hinting in SVG fonts means that small text which is antialiased will become unreadable in most cases. This problem is even more evident when text is rotated or animated.

Recommendation: Usage of device-native fonts is recommended. SVG fonts should be used with caution.

## L.2.9 Bitmap fonts

When using bitmapped fonts to display text, the content author needs to be aware of the limitations. Rotated text using a bitmapped font may be unreadable.

Recommendation: When using bitmapped fonts, content creators should avoid the display of text rotated at an arbitrary angle. Instead, only multiples of 90 degrees should be used to ensure readability.

## L.2.10 Animation

SVG animation has a non-uniform frame rate. The overall complexity of a scene determines the animation frame rate. Complex paths, stroking and property inheritance all have a potential negative impact on the complexity of a scene.

Animation of scale and/or rotation of images also have a significant impact on the fluidity of the rendering, as it is very similar to transformed video rendering in CPU requirement (frame-by-frame resizing, rotation and re-sampling of the bitmap).

Recommendation: Content creators should be cautious when designing animated content with lengthy or complex paths, extensive stroking or excessive property inheritance. Content creators should refrain from animating the scale or rotation of images on devices that do not support transformed video.

## L.2.11 User interaction and content navigation

Mobile devices do not provide the same amount of screen area and user input means as a PC. When designing interactive content for mobile devices it is therefore important to remember the potential limitations of the target hardware. For example, most mobile phones do not have a pointing device so having small "hot-spots" of user interaction on the screen is not recommended. Also, the user is typically involved in another activity when using a mobile device, unlike a PC where the machine usually has the user's undivided attention.

Recommendation: Content creators need to be aware of any potential limitations and design user interaction and content navigation accordingly.

---

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at <http://www.3gpp.org/specs/CR.htm>. Below is a brief summary:

- 1) Fill out the above form. The symbols above marked contain pop-up help information about the field that they are closest to.

- 2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under <ftp://ftp.3gpp.org/specs/> For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
- 3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

---

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

Ö <cut text> Ö

## 6.2 Sample Description box

In an ISO file, Sample Description Box gives detailed information about the coding type used, and any initialisation information needed for that coding. The Sample Description Box can be found in the ISO file format Box Structure Hierarchy shown in figure 6.1.

**Figure 6.1: ISO File Format Box Structure Hierarchy**

The Sample Description Box can have one or more Sample Entries. Valid Sample Entries already defined for ISO and MP4 include MP4AudioSampleEntry, MP4VisualSampleEntry and HintSampleEntry. The Sample Entries for AMR and AMR-WB shall be AMRSampleEntry, for AMR-WB+ it shall be AMRWPSampleEntry, for H.263 it shall be H263SampleEntry, [for H.264 \(AVC\) it shall be AVCSampleEntry](#), ~~and~~ for timed text it shall be TextSampleEntry, [and for hint tracks it shall be HintSampleEntry](#).

The format of SampleEntry and its fields are explained as follows:

```

SampleEntry ::=  MP4VisualSampleEntry |
                  MP4AudioSampleEntry |
                  AMRSampleEntry |
                  AMRWPSampleEntry |
                  H263SampleEntry |
                  AVCSampleEntry |
                  TextSampleEntry |
                  HintSampleEntry
  
```

**Table 6.1: SampleEntry fields**

Field	Type	Details	Value
MP4VisualSampleEntry		Entry type for visual samples defined in the MP4 specification.	
MP4AudioSampleEntry		Entry type for audio samples defined in the MP4 specification.	
AMRSampleEntry		Entry type for AMR and AMR-WB speech samples defined in clause 6.5 of the present document.	
AMRWPSampleEntry		Entry type for AMR-WB+ audio samples defined in clause 6.9 of the present document.	
H263SampleEntry		Entry type for H.263 visual samples defined in clause 6.6 of the present document.	
<a href="#">AVCSampleEntry</a>		<a href="#">Entry type for H.264 (AVC) visual samples defined in the AVC file format specification.</a>	
TextSampleEntry		Entry type for timed text samples defined in the timed text specification	
HintSampleEntry		Entry type for hint track samples defined in the ISO specification.	

From the above 86 Sample Entries, only the MP4VisualSampleEntry, MP4AudioSampleEntry, H263SampleEntry, AMRSampleEntry and AMRWPSampleEntry are taken into consideration here. TextSampleEntry is defined in [4], and HintSampleEntry in [7], and AVCSampleEntry in [20].

Ö <cut text> Ö

## 10.2 Sample entries for encrypted media tracks

The sample entries stored in the sample description box of a media track in a 3GP file identify the format of the encoded media, i.e. codec and other coding parameters. All valid sample entries for unencrypted media in a 3GP file are described in Clause 6. The principle behind storing encrypted media in a track is to disguise the original sample entry with a generic sample entry for encrypted media. Table 10.1 gives an overview of the formats (identifying sample entries) that can be used in 3GP files for signalling encrypted video, audio and text.

**Table 10.1: Formats for encrypted media tracks**

Format	Original format	Media content
'encv'	's263', 'mp4v', ' <a href="#">avc1</a> ', Ö	encrypted video: H.263, MPEG-4 visual, <a href="#">H.264(AVC)</a> , Ö
'enca'	'samr', 'sawb', 'sawp', 'mp4a', Ö	encrypted audio: AMR, AMR-WB, AMR-WB+, Enhanced aacPlus, AAC, Ö
'ent'	'tx3g', Ö	encrypted text: timed text, Ö

The generic sample entries for encrypted media replicate the original sample entries and include a Protection scheme information box with details on the original format, as well as all requirements for decrypting the encoded media. The EncryptedVideoSampleEntry and the EncryptedAudioSampleEntry are defined in Tables 10.2 and 10.3, where the ProtectionSchemeInfoBox (defined in clause 10.2) is simply added to the list of boxes contained in a sample entry.

**Table 10.2: EncryptedVideoSampleEntry**

Field	Type	Details	Value
BoxHeader.Size	Unsigned int(32)		
BoxHeader.Type	Unsigned int(32)		æncví

All fields and boxes of a visual sample entry, e.g. MP4VisualSampleEntry or H263SampleEntry.

<b>ProtectionSchemeInfoBox</b>		Box with information on the original format and encryption	
--------------------------------	--	------------------------------------------------------------	--

**Table 10.3: EncryptedAudioSampleEntry**

Field	Type	Details	Value
BoxHeader.Size	Unsigned int(32)		
BoxHeader.Type	Unsigned int(32)		æncái

All fields and boxes in an audio sample entry, e.g. MP4AudioSampleEntry or AMRSampleEntry.

<b>ProtectionSchemeInfoBox</b>		Box with information on the original format and encryption	
--------------------------------	--	------------------------------------------------------------	--

The EncryptedVideoSampleEntry and the EncryptedAudioSampleEntry can also be used with any additional codecs added to the 3GP file format, as long as their sample entries are based on the SampleEntry of the ISO base media file format [7].

The EncryptedTextSampleEntry is defined in Table 10.4. Text tracks are specific to 3GP files and defined by the Timed text format [4]. In analogy with the cases for audio and video, a ProtectionSchemeInfoBox is added to the list of contained boxes.

**Table 10.4: EncryptedTextSampleEntry**

Field	Type	Details	Value
BoxHeader.Size	Unsigned int(32)		
BoxHeader.Type	Unsigned int(32)		æncťí

All fields and boxes of TextSampleEntry.

<b>ProtectionSchemeInfoBox</b>		Box with information on the original format and encryption	
--------------------------------	--	------------------------------------------------------------	--

NOTE: The boxes within the sample entries defined in Tables 10.2-10.4 may not precede any of the fields. The order of the boxes (including the ProtectionSchemeInfoBox) is not important though.

### 10.3 Key management

The necessary requirements for decrypting media are stored in the Protection scheme information box. It contains the Original format box, which identifies the codec of the decrypted media, the Scheme type box, which identifies the protection scheme used to protect the media, and the Scheme information box, which contains scheme-specific data (defined for each scheme). It is out of the scope of this specification to define a protection scheme.

The Protection scheme information box and its contained boxes are defined in Tables 10.5 ñ 10.8.

**Table 10.5: ProtectionSchemeInfoBox**

Field	Type	Details	Value
<b>BoxHeader.Size</b>	Unsigned int(32)		
<b>BoxHeader.Type</b>	Unsigned int(32)		0xinf1
<b>BoxHeader.Version</b>	Unsigned int(8)		0
<b>BoxHeader.Flags</b>	Bit(24)		0
<b>OriginalFormatBox</b>		Box containing identifying the original format	
<b>SchemeTypeBox</b>		Box containing the protection scheme.	
<b>SchemeInformationBox</b>		Box containing the scheme information.	

Table 10.5: ProtectionSchemeInfoBox

<u>Field</u>	<u>Type</u>	<u>Details</u>	<u>Value</u>
<u>BoxHeader.Size</u>	<u>Unsigned int(32)</u>		
<u>BoxHeader.Type</u>	<u>Unsigned int(32)</u>		<u>0xinf1</u>
<u>OriginalFormatBox</u>		<u>Box containing identifying the original format</u>	
<u>SchemeTypeBox</u>		<u>Optional box containing the protection scheme.</u>	
<u>SchemeInformationBox</u>		<u>Optional box containing the scheme information.</u>	

**Table 10.6: OriginalFormatBox**

Field	Type	Details	Value
<b>BoxHeader.Size</b>	Unsigned int(32)		
<b>BoxHeader.Type</b>	Unsigned int(32)		0xрма1
<b>DataFormat</b>	Unsigned int(32)	original format	

**DataFormat** identifies the format (sample entry) of the decrypted, encoded data. The currently defined formats in 3GP files include 'mp4v', 'h263', '[avc1](#)', 'mp4a', 'samr', 'sawb', '[sawp](#)' and 'tx3g'.

**Table 10.7: SchemeTypeBox**

Field	Type	Details	Value
<b>BoxHeader.Size</b>	Unsigned int(32)		
<b>BoxHeader.Type</b>	Unsigned int(32)		0xсhm1
<b>BoxHeader.Version</b>	Unsigned int(8)		0
<b>BoxHeader.Flags</b>	Bit(24)		0 or 1
<b>SchemeType</b>	Unsigned int(32)	four-character code identifying the scheme	
<b>SchemeVersion</b>	Unsigned int(32+6)	Version number	
<b>SchemeURI</b>	Unsigned int(8)[]	Browser URI (null-terminated UTF-8 string). Present if (Flags & 1) true	

**SchemeType** and **SchemeVersion** identify the encryption scheme and its version. As an option, it is possible to include **SchemeURI** with an URI pointing to a web page for users that don't have the encryption scheme installed.

**Table 10.8: SchemeInformationBox-**

<b>Field</b>	<b>Type</b>	<b>Details</b>	<b>Value</b>
<b>BoxHeader.Size</b>	Unsigned int(32)		
<b>BoxHeader.Type</b>	Unsigned int(32)		0
<b>BoxHeader.Version</b>	Unsigned int(8)		0
<b>BoxHeader.Flags</b>	Bit(24)		0
		Box(es) specific to scheme identified by SchemeType	

**Table 10.8: SchemeInformationBox**

<u><b>Field</b></u>	<u><b>Type</b></u>	<u><b>Details</b></u>	<u><b>Value</b></u>
<u><b>BoxHeader.Size</b></u>	Unsigned int(32)		
<u><b>BoxHeader.Type</b></u>	Unsigned int(32)		0
		<u>Box(es) specific to scheme identified by SchemeType</u>	

The boxes contained in the Scheme information box are defined by the scheme type, which is out of the scope of this specification to define.

Ö <cut text> Ö

### 6.1 General

The purpose of this clause is to define the necessary structure for integration of the H.263, MPEG-4 video, AMR, AMR-WB, Extended AMR-WB (AMR-WB+), Enhanced aacPlus and AAC media specific information in a 3GP file. Clause 6.2 gives some background information about the Sample Description box in the ISO base media file format [7] and clauses 6.3 and 6.4 about the MP4VisualSampleEntry box and the MP4AudioSampleEntry box in the MPEG-4 file format [14]. The definitions of the Sample Entry boxes for AMR, AMR-WB, AMR-WB+ and H.263 are given in clauses 6.5 to 6.10. The integration of timed text in a 3GP file is specified in [4] and the integration of H.264 (AVC) is specified in [20].

AMR and AMR-WB data is stored in the stream according to the AMR and AMR-WB storage format for single channel header of Annex E [15], without the AMR magic numbers.

The 3GPP file format is the native storage format AMR-WB+. The data stream, stored in samples of a 3GP file, shall be formatted according to clause 8.3 of [21] ~~where the syntax of a sample for AMR-WB+ is defined by referring to the RTP payload format definition [22] and its basic mode.~~ Each sample contains one or more AMR-WB+ storage units. The number of storage units per sample may differ from sample to sample.

Ö <cut text> Ö

## 6.10 AMRWPSpecificBox field for AMRWPSampleEntry box

The AMRWPSpecificBox fields for AMR-WB+ shall be as defined in table 6.10. The AMRWPSpecificBox for the AMRWPSampleEntry Box shall always be included if the 3GP file contains AMR-WB+ media.

**Table 6.10: The AMRWPSpecificBox fields for AMRWPSampleEntry**

Field	Type	Details	Value
BoxHeader.Size	Unsigned int(32)		
BoxHeader.Type	Unsigned int(32)		ãlawpí
DecSpecificInfo	AMRWPDecSpecStruc	Structure which holds the AMR-WB+ Specific information	

**BoxHeader Size and Type:** indicate the size and type of the AMR-WB+ decoder-specific box. The type must be ãlawpí.

**DecSpecificInfo:** the structure where the AMR-WB+ stream specific information resides.

The AMRWPDecSpecStruc is defined as follows:

```
struct AMRWPDecSpecStruc{
    Unsigned int (32)   vendor
    Unsigned int (8)   decoder_version
}
```

The definitions of AMRWPDecSpecStruc members are as follows:

**vendor:** four character code of the manufacturer of the codec, e.g. 'VXYZ'. The vendor field gives information about the vendor whose codec is used to create the encoded data. It is an informative field, which may be used by the decoding end. If a manufacturer already has a four-character code, it is recommended that it uses the same code in this field. Else, it is recommended that the manufacturer creates a four character code which best addresses the manufacturer's name. It can be safely ignored.

**decoder\_version:** version of the vendor's decoder which can decode the encoded stream in the best (i.e. optimal) way. This field is closely tied to the vendor field. It may give advantage to the vendor which has optimal encoder-decoder version pairs. The value is set to 0 if decoder version has no importance for the vendor. It can be safely ignored.

**NOTE:** [For AMR and AMR-WB the AMRSpecificBox defines the number of frames that are stored in a sample. For AMR-WB+, however, the AMRWPSpecificBox does not specify an overall sample structure, as the number of storage units per sample may differ from sample to sample.](#)

## CHANGE REQUEST

⌘ 26.245 CR 001 ⌘ rev 1 ⌘ Current version: 6.0.0 ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:**  UICC apps⌘  ME  Radio Access Network  Core Network

<b>Title:</b>	⌘ Removal of incorrect statement in Scope section of Rel-6 Timed Text		
<b>Source:</b>	⌘ TSG-SA WG4		
<b>Work item code:</b>	⌘ PSSrel6-Stage3	<b>Date:</b>	⌘ 14/12/2004
<b>Category:</b>	⌘ <b>F</b>	<b>Release:</b>	⌘ Rel-6
	<i>Use <u>one</u> of the following categories:</i> <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP <a href="#">TR 21.900</a> .		<i>Use <u>one</u> of the following releases:</i> <b>Ph2</b> (GSM Phase 2) <b>R96</b> (Release 1996) <b>R97</b> (Release 1997) <b>R98</b> (Release 1998) <b>R99</b> (Release 1999) <b>Rel-4</b> (Release 4) <b>Rel-5</b> (Release 5) <b>Rel-6</b> (Release 6) <b>Rel-7</b> (Release 7)

<b>Reason for change:</b>	⌘ The statement is untrue.
<b>Summary of change:</b>	⌘ Remove "timed text is not streamed" as in Rel-6 there is a streaming definition.
<b>Consequences if not approved:</b>	⌘ The scope section is seriously misleading

# 1 Scope

The present document defines the timed text format relative to the 3GPP file format. This specification defines the format of timed text in downloaded files. ~~In this release, timed text is downloaded, not streamed.~~
