The T2 MExE group would like to bring to S3's attention the Security Analysis Activity that was initiated in the T2 MExE meeting held on the 13th of February 2001.  The Work Item Description for this activity is attached.

Part of this initiative is to encourage the attendance of security experts from the participatory companies within T2 MExE, including delegates from S3, and for them to take a more proactive role within the group. This expertise is considered to be essential to the success of MExE and to the development of supplementary security documentation.

The development of the supplementary security documentation is expected to incorporate a textual description of a MExE device and the environment that it interacts with, specifically in terms of security concepts and security mechanisms. Also it is expected to determine the potential threats and potential weaknesses associated with a MExE device and its surrounding infrastructure.

T2 MExE looks forward to a continuing fruitful co-operation with S3 and specifically would like to hear their views on participation, and possible joint meetings, regarding this activity.
