S3-010369 Proposed CR to 33102-400 Visibility and configurability

S3-010369.zip

SA3 at its meeting #19 in Newbury reviewed the status of the visibility and configurability of security features in the security architecture, 33.102. Most importantly this topic refers to the use of encryption on the radio interface and the possibility for the user to decide if he wants to accept or reject non-ciphered connections

SA3 has agreed on the principles of how these mechanisms should work and wishes to clarify the description of them in 33.102 as the present writing is not clear enough for unambiguous implementations.

The clarifications are to be found in the attached proposed CR.

Before continuing on this item, SA3 wishes to liaise with CN1 and T2 on the feasibility of these clarifications.

Specifically SA3 wishes to know:

- are there any objections to proceed with the CR as described?
- Is there an impact on other specifications not yet identified and can corresponding CRs in that case be produced?

The CR was originally written for Rel-4. It was expressed at SA3 meeting that Rel-5 was more adequate,

The USIM is not intended to be involved in any of the mechanisms, the LS is sent to T3 for information only.
