Hi all:

As we announced during the last CN1 #22 bis meeting, we will hold a conference call this Wednesday to inspect the "3GPP requirements to SIP" Internet Draft.

As you may know, this internet draft is not the product of any 3GPP working group, but a submission of certain individuals.

I am enclosing a "working document" with the latest updates and additions. If you have comments, please send them to any of the authors listed in the draft and/or the CN1 mailing list.

The list of changes from the previous version is summarized as:

- References are updated
- Clarified that these requirements apply to the Release 5 of the 3GPP set of specifications
- Added a references to draft-ietf-sip-srv-04.txt
- Removed the connection of visited domain name with DNS domain names.
- Clarified that the private user ID is not sent in the From header of the REGISTER request.
- Added a suggestion about how the user is notified of the implicitly registered public user identities.

- Clarified that emergency sessions are not applicable for 3GPP Release 5.
- Clarified that anonymity is not a requirement in 3GPP Release 5
- Clarified the single codec negotiation requirement
- The charging requirements have been completed.
- The security requirements don't refer to HTTP EAP AKA, but to Digest AKA instead.

As you may also know, we will hold a conference call this Wednesday to inspect the enclosed document. In order to manage the conference, the idea is to have no more than a participant per company. At the moment I have reserved one port per company. If you have other requirements, please let me know.

Best regards,

Miguel
