1. Overall Description:

SA3 would like to thank CN1 and SA for communicating their Liaison statement on Interoperability Issues and SIP in IMS. As requested, SA3 have discussed all issues listed and concluded same view as CN1. Furthermore, SA3 would like to point out a couple of matters related to security below.

The usage of S/MIME from UA to UA mentioned in issue 3 and 7, would sacrifice current 3GPP requirements as pointed by CN1 in their Liaison statement. When tunnelling SIP messages inside S/MIME, requirements pointed out in issue 2 would be prohibited as well. An alternative may be investigated whether S/MIME usage could be exercised between one 3GPP network element and an non-3GPP-IMS-compatible User Agent. Due to the stringent timetable, however, SA3 do not believe the investigation could be concluded in R5.

Issue 1 discusses P-CSCF initiating BYE request on behalf of IMS-compatible terminal. Other than CN1's answer, SA3 observe another scenario when non-IMS-compatible User Agent would like to authenticate BYE request from IMS P-CSCF. In this case, the external User Agent is a valid one instead of an attacker. Still, SA3 agree CN1's conclusion that forged BYE from external network is the Internet interoperability issue as well as the scenario pointed in this Liaison statement.

Regarding to P-CSCF performing identity checks (issue 5), SA3 confirm that no claim has been raised up in SA3 to change security requirements for IMS. It is seen an essential thing that operator's network must be able to verify the identity has an association with private ID to be charged, and the association should be established before usage. This however, does not impose restriction to services provided by any third party as explained by CN1 in their Liaison statement.

2. Actions To SA1, SA2, CN1:

SA3 kindly ask SA1, SA2 and CN1 to give comments on SA3's opinion, and communicate SA3 if any changes raise up in future.

3. Date of Next SA3 Meetings:

SA3 #26	19 – 22 Nov. 2002	Oxford, UK.
SA3#27	25 - 28 Feb. 2003	TBC
