

TD-SCDMA Industry Alliance and 3GPP

TDIA

Oct. 2005

- **What is TDIA?**
- Latest developments of TD-SCDMA industrialization and its development plan
- Marketing Activities and Cooperation between TDIA and 3GPP

What is TDIA

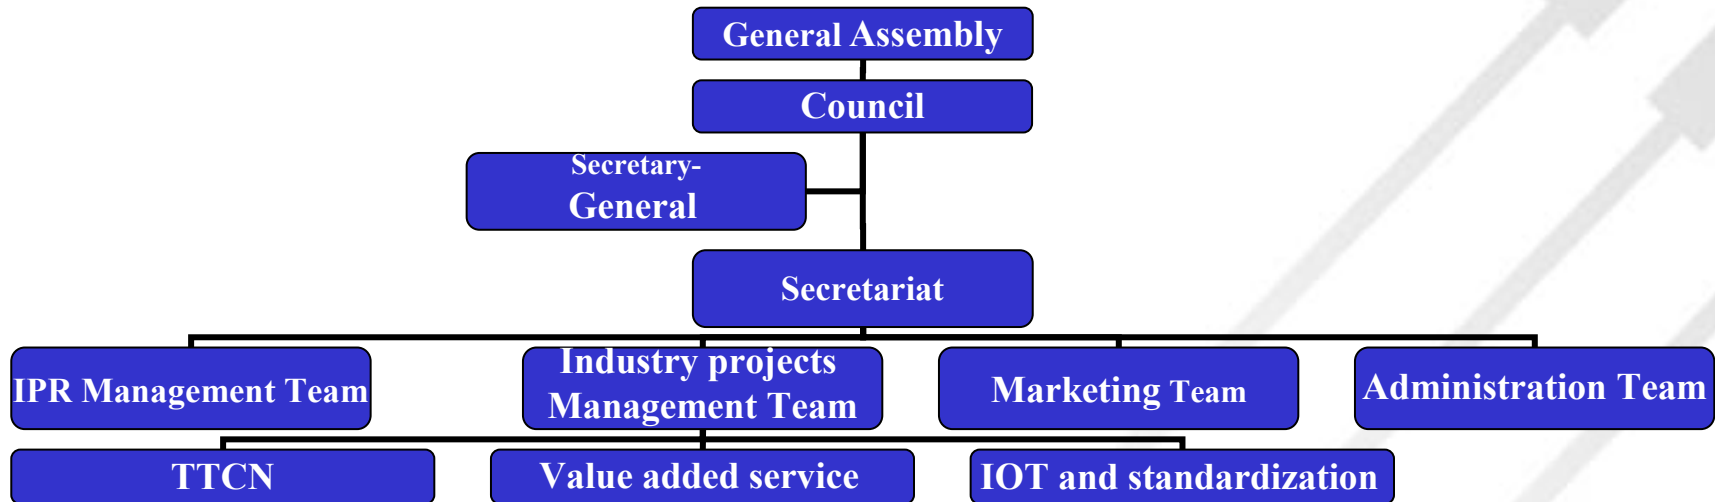

- 22 members, including 8 council members
- All members are guided by TDIA regulations, and contribute and share IPR according to TDIA policy
- All members actively involved in industrialization of TD-SCDMA

Council Members

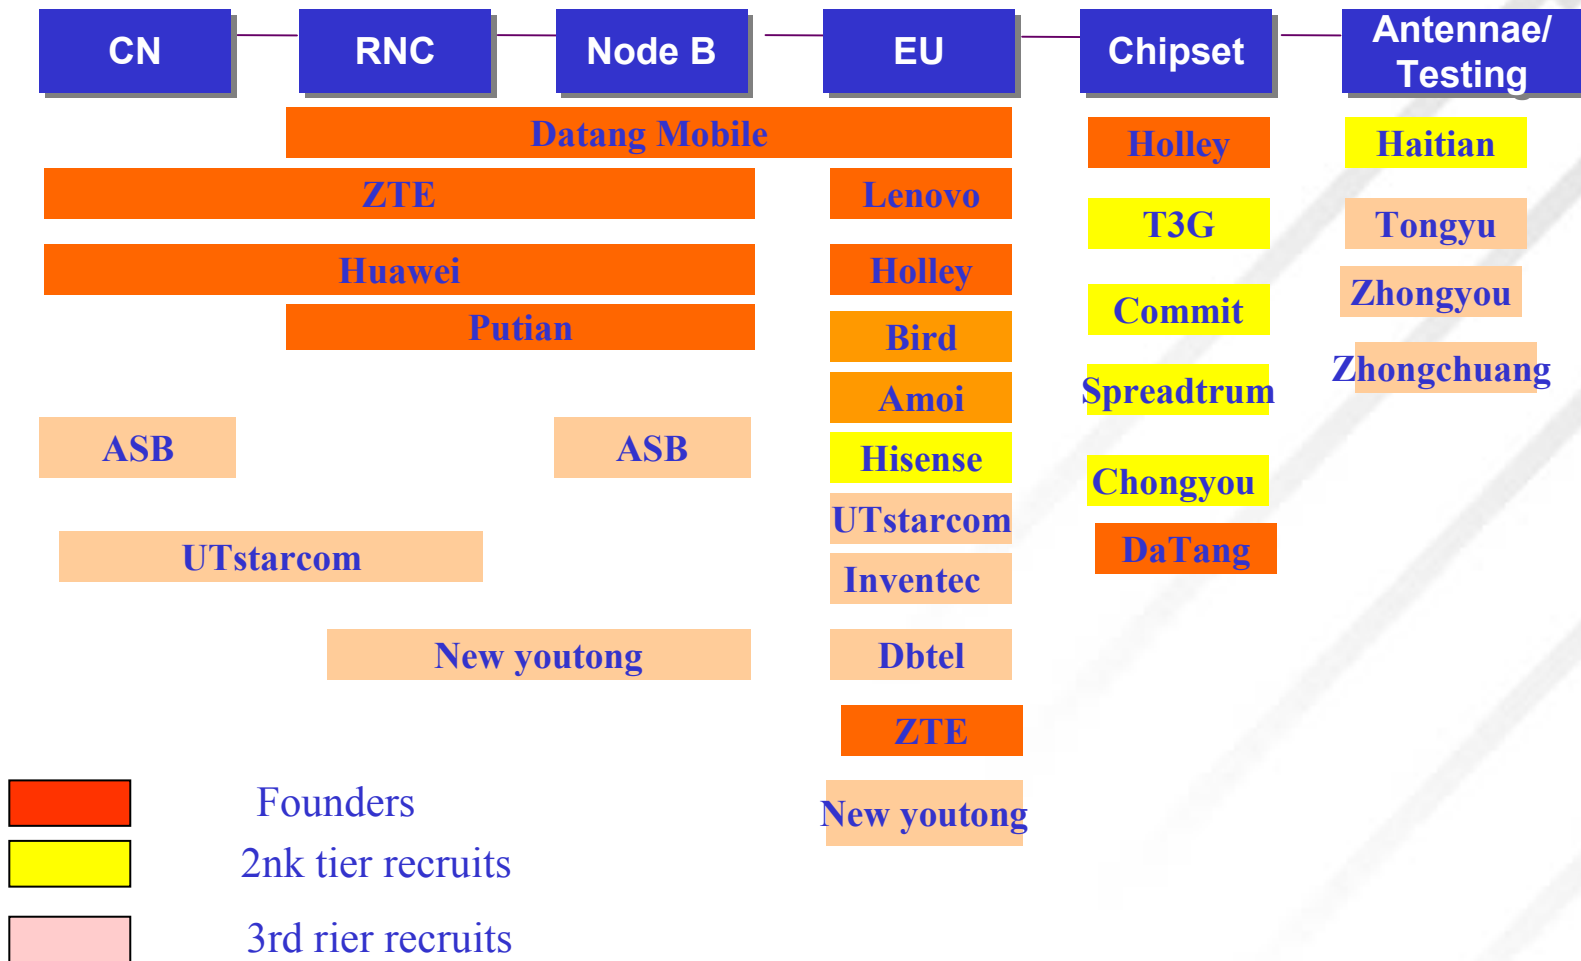

Non Council Members

Mission:

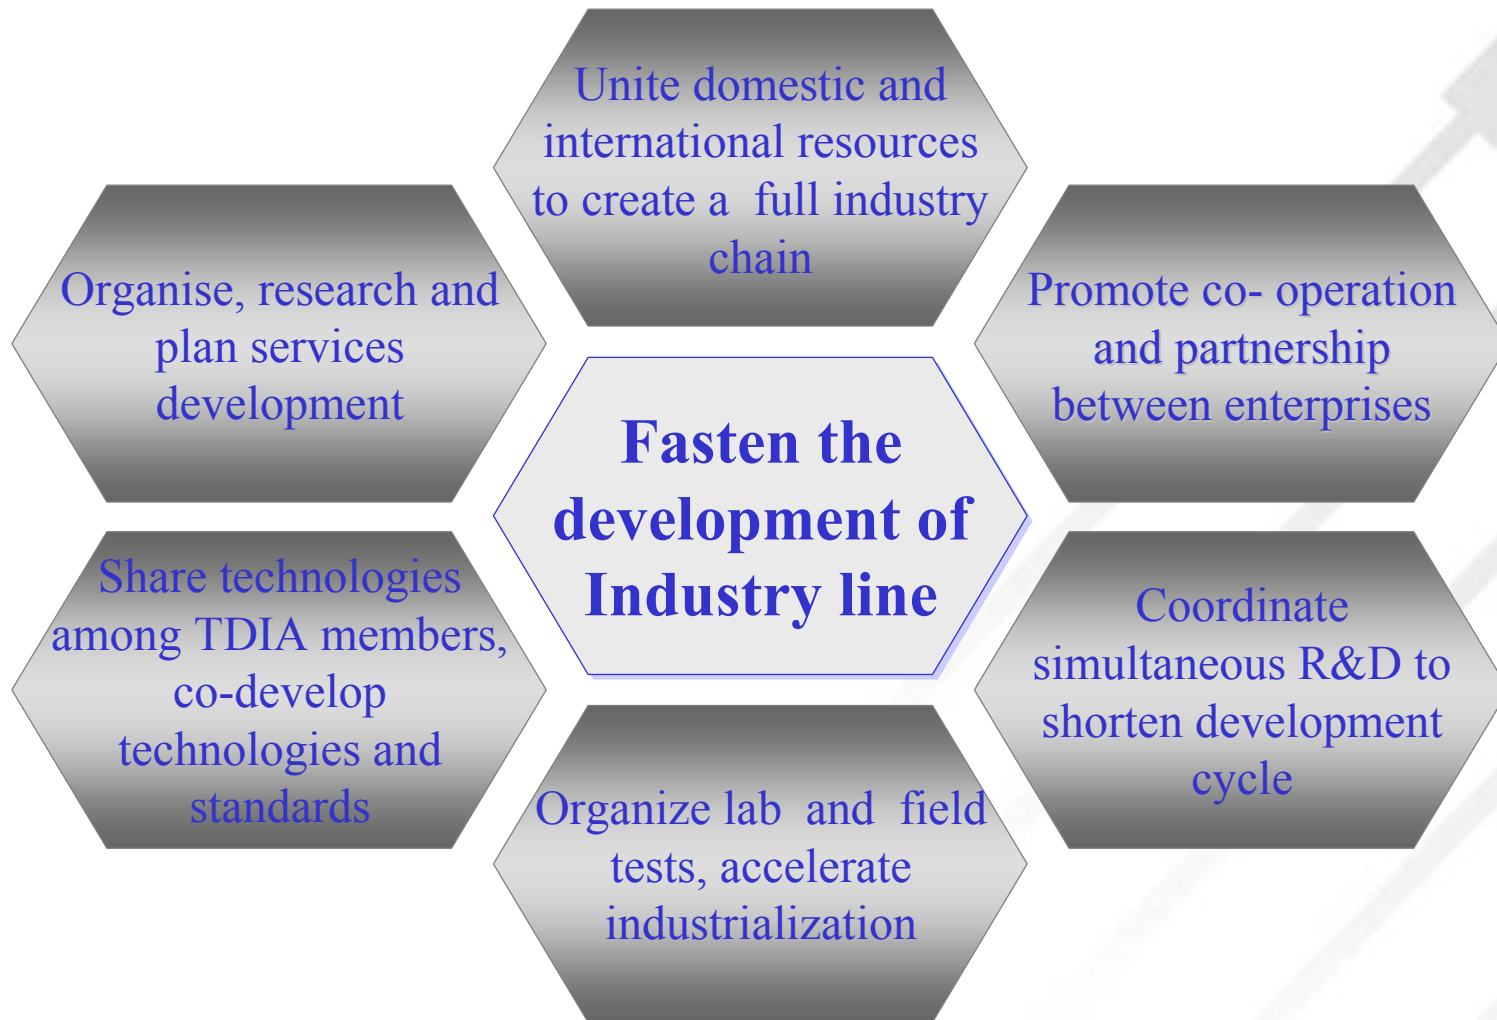

- Promote the technological development and industrialization of TD-SCDMA
- Integrate and coordinate industry resources among members
- Improve the development of the TD-SCDMA market and applications
- Support the development of TDIA members

The Distribution of TDIA Members

Fasten Development of Industry Chain

International Participated TD-SCDMA

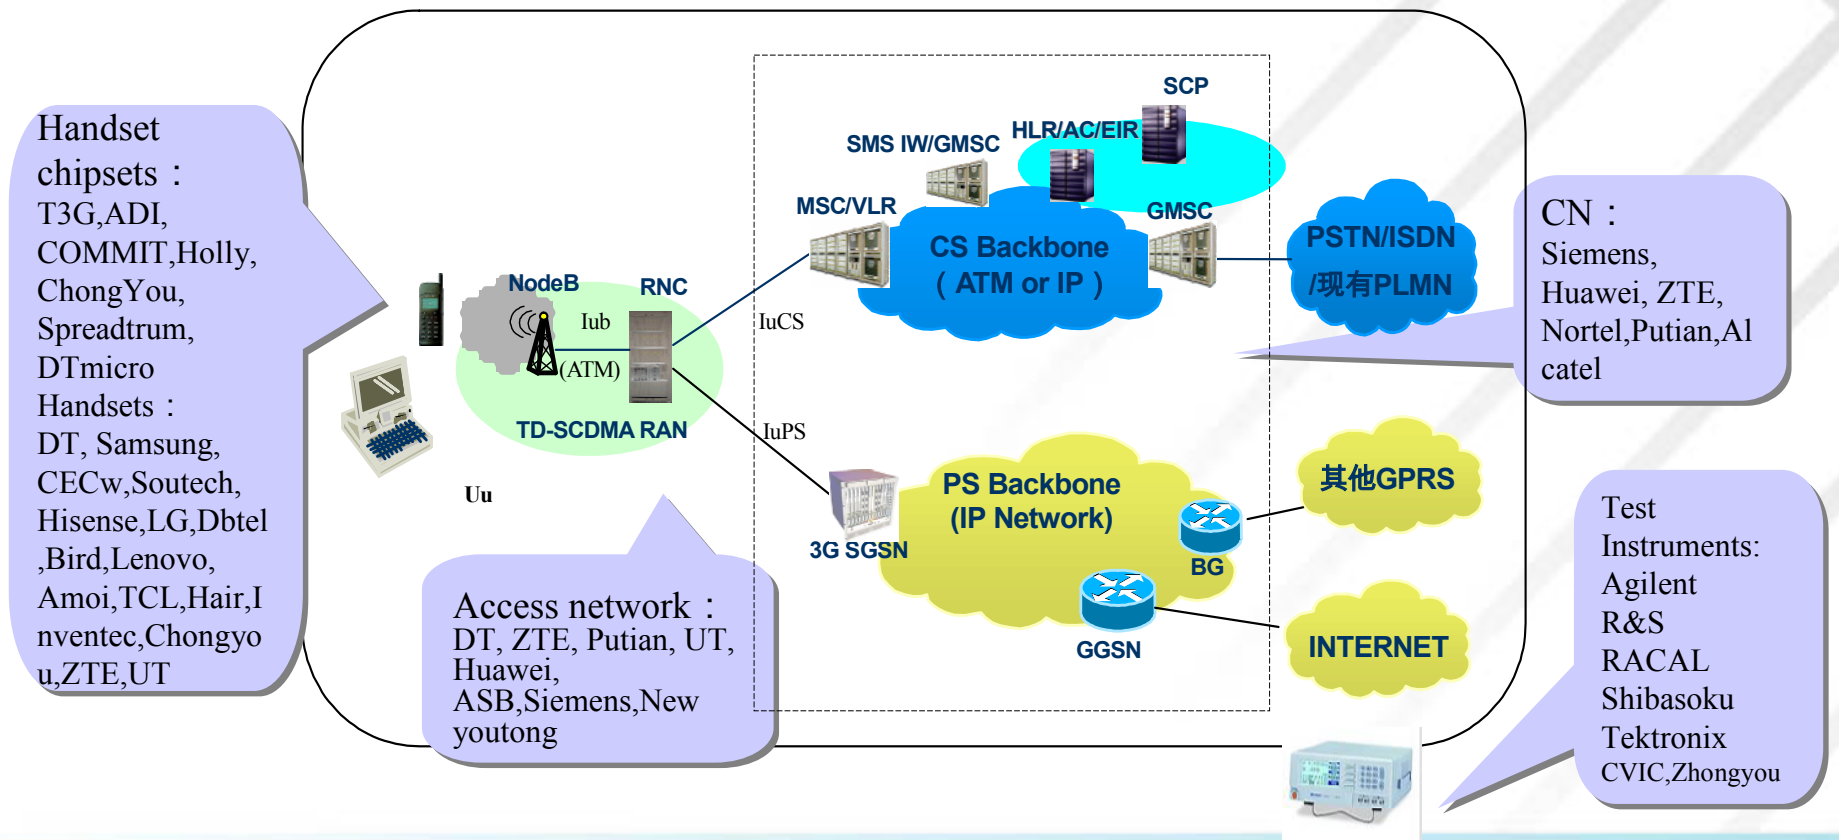

Systems Equipment	 	 
	 	 
		
Chipset	   	    
User Equipment	  	
Others

- Latest developments of TD-SCDMA industrialization and its development plan
- Marketing Activities and Cooperation between TDIA and 3GPP

Reasons behind TD-SCDMA success in China

—Good product planning and performance in the industrialization process serve supports for TD-SCDMA success!

● At present, the multi-supplier environment of TD-SCDMA has formed in each process to guarantee the commercialized products time to market.

All systems equipment vendors have started their LTE campaign. TD-SCDMA strengthened commercial equipments, enabled with HSDPA, will be available in 1HY 2006.

2

TD-SCDMA terminals support all 3G services such as video phone, and VOD.

The UE power is able to last 80-100 hrs

Commercial production will start at the beginning of 2006.

1 Systems vendors have completed the 1st commercial system version with a full series of equipment such as macro and micro cellular, and single and multi carrier serials equipments. Large scale production will commence by the end of the year.

*TD-SCDMA call
for commercial
service*

4

3 TD-SCDMA chipsets support voice and data service with handover and interoperation ability; Support up to 384K data speeds ;

Will provide total solution and chipsets for mass market demand by the end of 2005

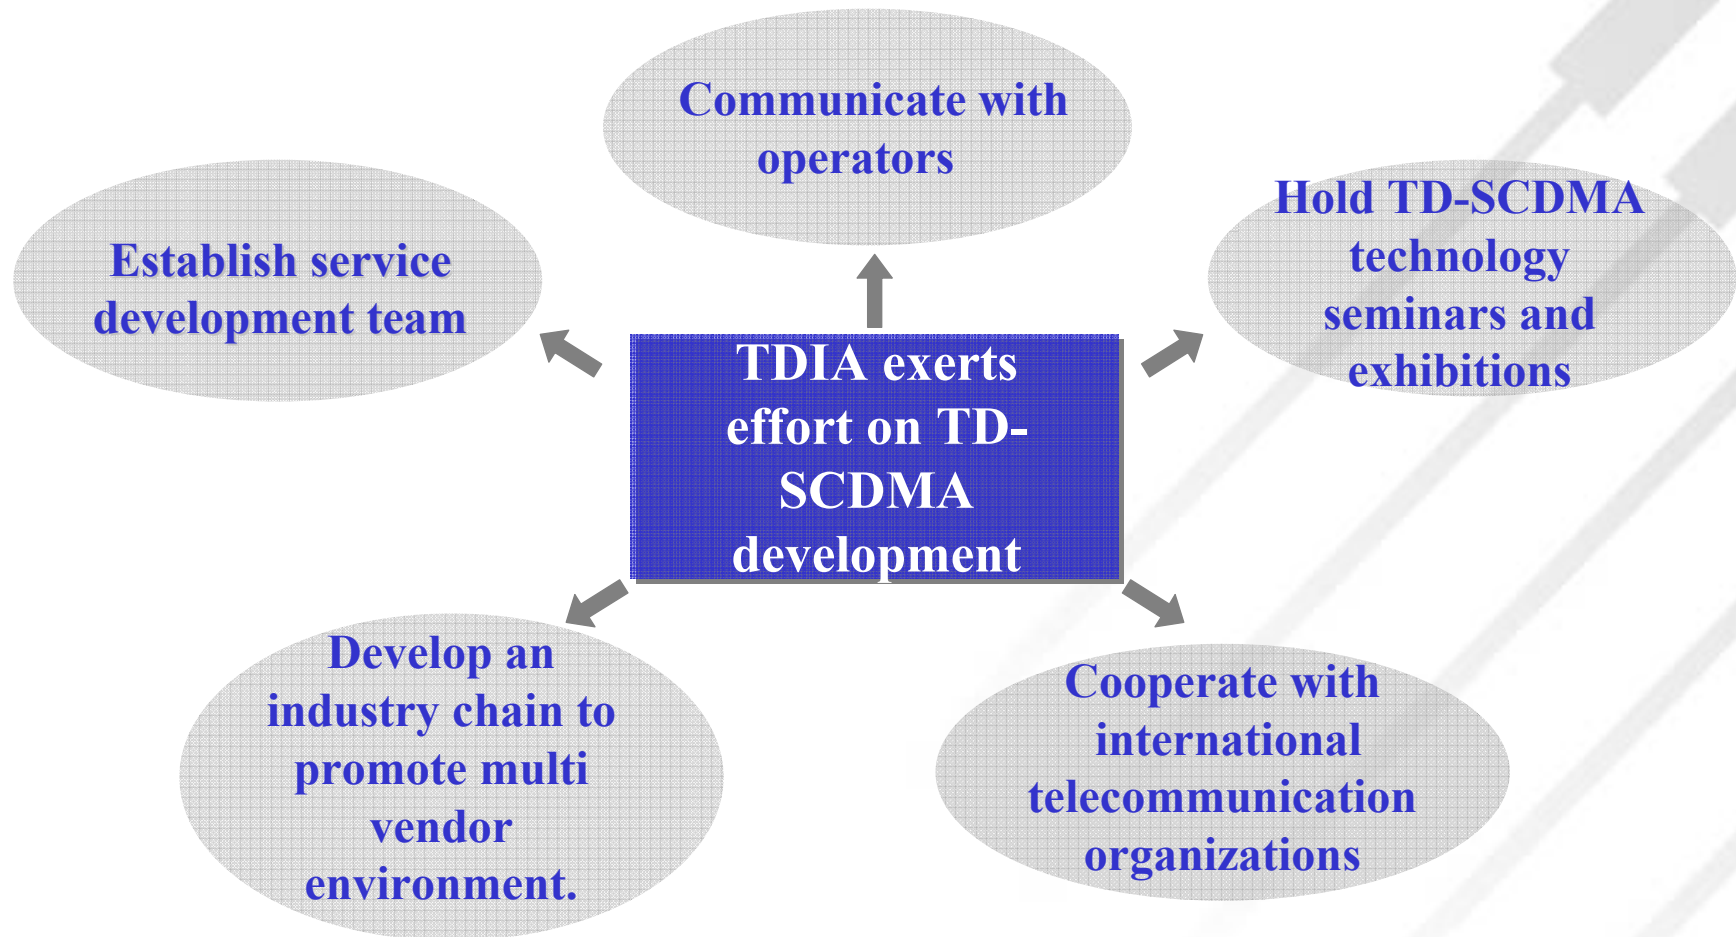

Latest Development of TD-SCDMA: Network Performance

- The efficiency of TD-SCDMA system key technologies such as SA, Baton Handover, DCA, and Joint Detection has been proved in field testing.
- The systems coverage achieved the maximum level of theoretical design with a full local cell loading and real loading in adjacent cells; the system performance met the requirement of standalone networking.
- The local cell volume achieved the max level of theoretical design under disturbance at the same or different frequency from an adjacent cell.
- In tests, under 10M bandwidth TD-SCDMA supports 12 asymmetric data services (1:5) at the speed of 384K , which **proved the high spectrum efficiency of TD-SCDMA**
- The field test has proved that TD-SCDMA is fully capable of supporting commercial service.

Marketing Activities

Work with 3GPP

- * TDIA takes parts in the 3GPP LTE program. One member has submitted 2 TDD standard evolution reports, while other members have also made significant contributions to the TD-SCDMA LTE study.
- * TDIA will organize members to contribute to the 3GPP LTE program.

- * TDIA will share the latest development of TD-SCDMA with 3GPP
- * TDIA will assist 3GPP with market study and information collection in China and world telecommunication markets
- * TDIA will be active in 3GPP programs and promote 3GPP's presence in China and globally

- * Sent experts to 3GPP to develop TTCN code since April 2004
- * Handed in + 80 CRs, and finished +300 testing cases.
- * Cooperating with sound testing Labs

Work for Tomorrow

- Will promote further cooperation in TTCN. Plan to finish code development in two years and start code certification work soon.
- Promote the standardization of TDD technology and guide its evolution
- Work together with all 3GPP members under the framework of 3GPP to promote 3G development in the world.

Thanks !
