## CHANGE REQUEST

⌘ **33.220 CR 035** ⌘ rev **1** ⌘ Current version: **6.2.0** ⌘

For **HELP** on using this form, see bottom of this page or look at the pop-up text over the ⌘ symbols.

**Proposed change affects:** | UICC apps  ME  Radio Access Network  Core Network

<b>Title:</b>	⌘ Complete the MAC modification for GBA_U		
<b>Source:</b>	⌘ Siemens		
<b>Work item code:</b>	⌘ SEC1-SC	<b>Date:</b>	⌘ 15/11/2004
<b>Category:</b>	⌘ <b>F</b>	<b>Release:</b>	⌘ Rel-6
	Use <u>one</u> of the following categories: <b>F</b> (correction) <b>A</b> (corresponds to a correction in an earlier release) <b>B</b> (addition of feature), <b>C</b> (functional modification of feature) <b>D</b> (editorial modification) Detailed explanations of the above categories can be found in 3GPP <a href="#">TR 21.900</a> .		Use <u>one</u> of the following releases: 2 (GSM Phase 2) R96 (Release 1996) R97 (Release 1997) R98 (Release 1998) R99 (Release 1999) Rel-4 (Release 4) Rel-5 (Release 5) Rel-6 (Release 6)

<b>Reason for change:</b>	⌘ - Correction of wrong symbols ⌘ - Removal of editor's Note by proposing a hash truncation
<b>Summary of change:</b>	⌘ Complete the MAC modification for GBA_U
<b>Consequences if not approved:</b>	⌘ Incomplete specification

<b>Clauses affected:</b>	⌘ 2, 5.3.2, New clauses 3.3 and 3.4						
<b>Other specs affected:</b>	<table border="1" style="display: inline-table; border-collapse: collapse;"> <tr> <td style="width: 20px; text-align: center;">Y</td> <td style="width: 20px; text-align: center;">N</td> </tr> <tr> <td style="text-align: center;"><input type="checkbox"/></td> <td style="text-align: center;"><input checked="" type="checkbox"/></td> </tr> </table> Other core specifications	Y	N	<input type="checkbox"/>	<input checked="" type="checkbox"/>	⌘

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

\*\* NEXT CHANGE \*\*\*

### 3.3 Symbols

For the purposes of the present document, the following symbols apply:

|| Concatenation  
⊕ Exclusive or

### 3.4 Conventions

All data variables in this specification are presented with the most significant substring on the left hand side and the least significant substring on the right hand side. A substring may be a bit, byte or other arbitrary length bitstring. Where a variable is broken down into a number of substrings, the leftmost (most significant) substring is numbered 0, the next most significant is numbered 1, and so on through to the least significant.

\*\* END OF CHANGE \*\*\*

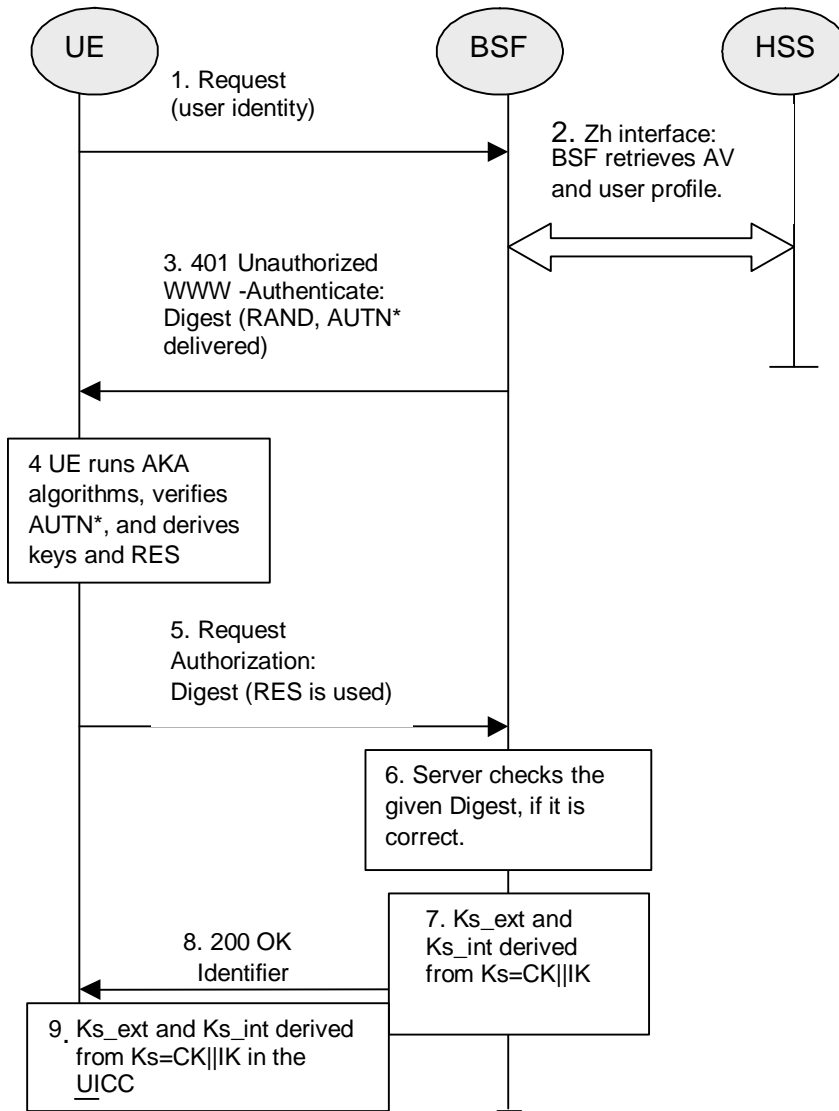

\*\* LAST CHANGE \*\*\*

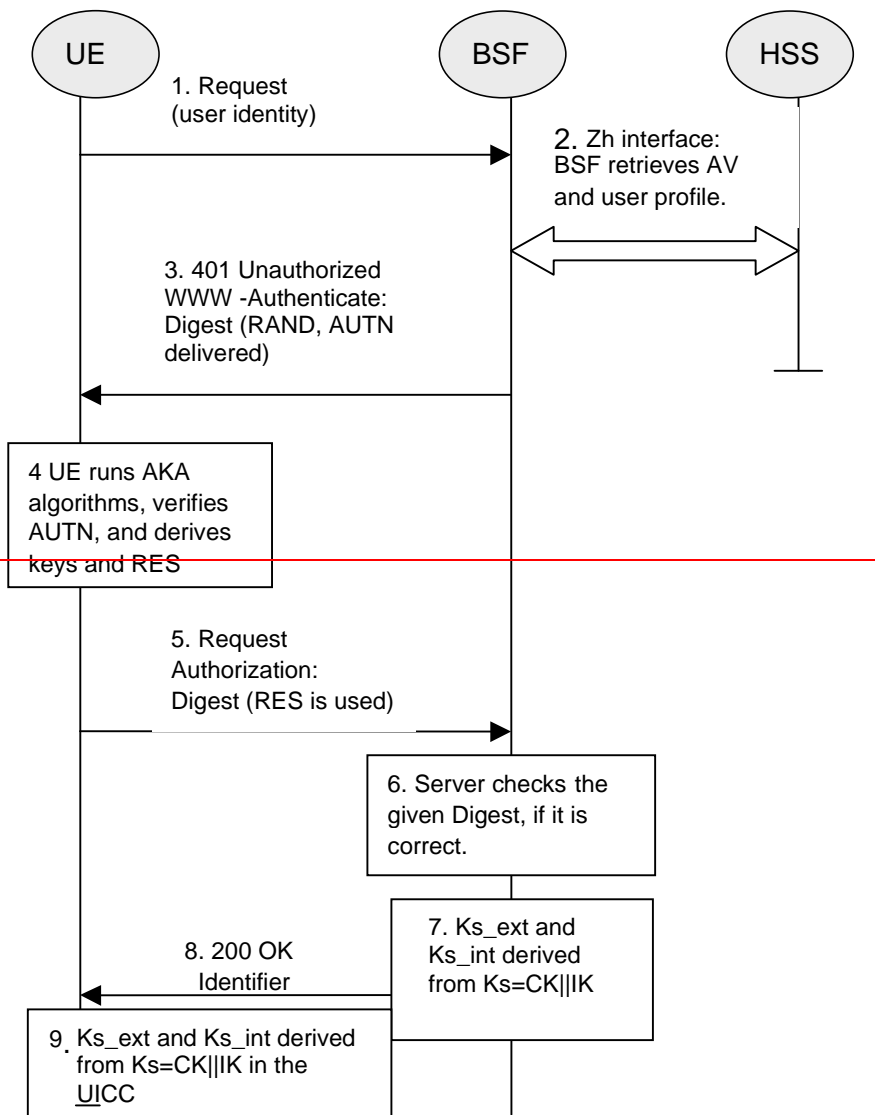

#### 5.3.2 Bootstrapping procedure

The procedure specified in this clause differs from the procedure specified clause 4.5.2 in the local handling of keys and Authentication Vectors in the UE and the BSF. The messages exchanged over the Ub reference point are identical for both procedures.

When a UE wants to interact with a NAF, and it knows that the bootstrapping procedure is needed, it shall first perform a bootstrapping authentication (see figure 5.1). Otherwise, the UE shall perform a bootstrapping authentication only when it has received bootstrapping initiation required message or a bootstrapping renegotiation indication from the NAF, or when the lifetime of the key in UE has expired (see clause 5.3.3).

NOTE: The main steps from the specifications of the AKA protocol in TS 33.102 [2] and the HTTP digest AKA protocol in RFC 3310 [4] are repeated in figure 5.1 for the convenience of the reader. In case of any potential conflict, the specifications in TS 33.102 [2] and RFC 3310 [4] take precedence.

**Figure 5.1: The bootstrapping procedure with UICC-based enhancements**

1. The ME sends an HTTP request towards the BSF.
2. The BSF retrieves the complete set of GBA user security settings and one or a whole batch of Authentication Vectors (AV, AV = RAND||AUTN||XRES||CK||IK) over the Zh reference point from the HSS. The BSF can then decide to perform GBA\_U, based on the user security settings (USSs). In this case, the BSF proceeds in the following way:

- BSF computes  $MAC^* = MAC \oplus \text{Trunc}(\text{SHA-1}(IK_1))$  (where  $IK = IK_1 || IK_2$  and \* is a exclusive or as described in TS 33.102 [2])

NOTE: Trunc denotes that from the 160 bit output of SHA-1[15], the 64 bits numbered as [0] to [63] are used within the  $\oplus$  operation to MAC.

~~Editor's note: The exact format of the MAC modification function is to be reviewed. The output of SHA-1 needs to be truncated to exact amount of bits needed (64 bits).~~

The BSF stores the XRES after flipping the least significant bit.

3. Then BSF forwards the RAND and AUTN\* (where  $AUTN^* = SQN \oplus AK || AMF || MAC^*$ ) to the UE in the 401 message (without the CK, IK and XRES). This is to demand the UE to authenticate itself.

4. The ME sends RAND and AUTN\* to the UICC. The UICC calculates IK and MAC (by performing  $MAC = MAC^* \oplus \text{Trunc}(\text{SHA-1}(\text{IK} \oplus \text{RAND}))$ ). Then the UICC checks AUTN (i.e.  $\text{SQN} \oplus \text{AK} \parallel \text{AMF} \parallel \text{MAC}$ ) to verify that the challenge is from an authorised network; the UICC also calculates CK and RES. This will result in session keys CK and IK in both BSF and UICC.
5. The UICC then applies a suitable key derivation function h1 to Ks, which is the concatenation of CK and IK, and possibly further h1-key derivation parameters to obtain two keys, Ks\_ext and Ks\_int, each of length 128 bit, i.e.  $h1(\text{Ks}, \text{h1 key derivation parameters}) = \text{Ks\_ext} \parallel \text{Ks\_int}$  (see also figure 5.2). The UICC then transfers RES (after flipping the least significant bit) and Ks\_ext to the ME and stores Ks\_int/Ks\_ext on the UICC.

**Editors' Note:** The definition of the h1 is left to ETSI SAGE and is to be included in the Annex B of the present specification.

**Editors' Note:** The location (whether in the UICC or in the ME) of the storage of Ks\_ext is ffs.

6. The ME sends another HTTP request, containing the Digest AKA response (calculated using RES), to the BSF.
7. The BSF authenticates the UE by verifying the Digest AKA response.
8. The BSF generates the key Ks by concatenating CK and IK. Then the BSF applies the key derivation function h1 to Ks and possibly further h1-key derivation parameters to obtain two keys, Ks\_ext and Ks\_int, in the same way as the UICC did in step 5. The B-TID value shall be also generated in format of NAI by taking the base64 encoded [12] RAND value from step 3, and the BSF server name, i.e.  $\text{base64encode}(\text{RAND})@BSF\_servers\_domain\_name$ .
9. The BSF shall send a 200 OK message, including the B-TID, to the UE to indicate the success of the authentication. In addition, in the 200 OK message, the BSF shall supply the lifetime of the keys Ks\_ext and Ks\_int. The lifetimes of the keys Ks\_ext and Ks\_int shall be the same.
10. The BSF shall use the keys Ks\_ext and Ks\_int to derive the NAF-specific keys Ks\_ext\_NAF and Ks\_int\_NAF, if requested by a NAF over the Zn reference point. Ks\_ext\_NAF and Ks\_int\_NAF are used for securing the Ua reference point. The UE shall use the key Ks\_ext to derive the NAF-specific key Ks\_ext\_NAF, if applicable. The UICC shall use the key Ks\_int to derive the NAF-specific key Ks\_int\_NAF, if applicable.

Ks\_ext\_NAF is computed as  $\text{Ks\_ext\_NAF} = h2(\text{Ks\_ext}, \text{h2-key derivation parameters})$ , and Ks\_int\_NAF is computed in the UICC as  $\text{Ks\_int\_NAF} = h2(\text{Ks\_int}, \text{h2-key derivation parameters})$ , where h2 is a suitable key derivation function, and the h2-key derivation parameters include the user's IMPI, the NAF\_Id and RAND. The NAF\_Id consists of the full DNS name of the NAF.

**Editors' Note:** The definition of the h2 is left to ETSI SAGE and is to be included in the Annex B of the present specification.

NOTE: The NOTE 2 of clause 4.5.2 also applies here.

The ME, the UICC and the BSF store the keys Ks\_ext and Ks\_int together with the associated B-TID for further use, until the lifetime of Ks\_ext and Ks\_int has expired, or until the keys Ks\_ext and Ks\_int are updated.
