Title: CN Domain Identifiers used over the lu & lur Interfaces

Document: For Information

TSG S2 thanks R3 for LS (R3-99784) related to CN Domain Identifiers. Since S2 identified a discrepancy on the definition of CN domain Identifiers, S2 would like to inform you of the current status of CN domain identifiers for your information.

The following is quoted form the LS R3-99784;

CN PS Domain Identity

PLMN-Id

RAC

Since RAC is unique only in LAI in the current UMTS 23.003, "LAI + RAC," not "RAC", is necessary to identify a PS CN node within one PLMN in the UMTS. To be compliant with UMTS 23.003 the CN PS Domain Identity would be PLMN-Id + LAC + RAC. This structure needs to be followed in UMTS to maintain interoperation with second generation systems.
