Title: Text proposal regarding TFCI coding for TDD

**Document for:** Approval

### **Proposed Text**

Samsung proposed the new Extended TFCI coding scheme having an optimal minimum distance and almost no complexity increase in [1]. This text proposal describes the text changes regarding TFCI coding for TDD mode according to the contribution.

----- Start of Proposed Text -----

# 6.3 Coding for layer 1 control

# 6.3.1 Coding of transport format combination indicator (TFCI)

The number of TFCI bits is variable and is set at the beginning of the call via higher layer signalling. Encoding of the TFCI bits depends on the number of them. If there are at most 6 bits of TFCI the channel encoding is done as described in section Error! Reference source not found. Correspondingly, if the TFCI word is extended to 7 10 bits the channel encoding is done as explained in the section 6.3.1.2. Also specific coding of less than 6 bits is possible as explained in 6.3.1.3. For improved TFCI detection reliability repetition is used to increase the number of TFCI bits. Additionally, with any TFCI coding scheme it is assumed that in the receiver combining of two successive TFCI words will be performed if the shortest transmission time interval of any TrCH is at least 20 ms.

#### 6.3.1.1 Default TFCI word

If the number of TFCI bits is 6-10 a biorthogonal (32, 6) block code (32,10) sub-code of the second order Reed-Muller code is used.

If the TFCI consist of 6-9bits, it is padded with zeros to 10 bits, by setting the most significant bits to zero. The receiver can use the information that not all 10 bits are used for the TFCI, thereby reducing the error rate in the TFCI decoder.

The code words of the biorthogonal (32, 6) code are from two mutually biorthogonal sets,  $S_{C_5} = \{C_5(0), C_5(1), \dots, C_5(31)\} \text{ and its binary complement, } \overline{S}_{C_5} = \{\overline{C}_5(0), \overline{C}_5(1), \dots, \overline{C}_5(31)\}.$ 

Words of set  $S_{C5}$  are from the level 5 of the code three, which is generated, using the short code generation method defined in chapter 6.2 of 25.213. The mapping of information bits to code words is shown in the Error! Reference source not found..

Table 6.3.1- 1 Mapping of information bits to code words for biorthogonal (32, 6) code.

miormation bits Coue word
---------------------------

000000	$C_{5}(0)$
000001	$\overline{C_5(0)}$
000010	$\frac{C_{5}(1)}{C_{5}(1)}$
<del></del>	<del></del>
<del>111101</del>	$\overline{C_{5}(30)}$
<del>111110</del>	$\frac{C_5(31)}{}$
<del>111111</del>	$\frac{\overline{C_5(31)}}{}$

#### 6.3.1.2 Extended TFCI word

If the number of TFCI bits is 7-10 the TFCI information field is split into two words of length 5 bits as shown in the following formula:

 $n := \sqrt{TFCI}$ ; n is the largest integer being smaller than or equal to the square root of the transmitted TFCI value.

if 
$$TFCI < n^2 + n$$

then 
$$Word1 := n : Word2 := TFCI - n^2$$

else-Word 2:= 
$$n$$
: Word 1:=  $n^2$  +  $2n$  -  $TFCI$ 

Both of the words are encoded using biorthogonal (16, 5) block code. The code words of the biorthogonal (16, 5) code are from two mutually biorthogonal sets,  $S_{C_4} = \{C_4(0), C_4(1), ..., C_4(15)\}$  and its binary complement,  $\overline{S}_{C_4} = \{\overline{C}_4(0), \overline{C}_4(1), ..., \overline{C}_4(15)\}$ . Words of set  $S_{C_4}$  are from the level 4 of the code three, which is generated, using the short code generation method defined in TS 25.223. The mapping of information bits to code words is shown in the Table 6.3.1 2.

Table 6.3.1-2 Mapping of information bits to code words for biorthogonal (16, 5) code.

Information bits	Code word
00000	$-C_4(0)$
<del>00001</del>	$\overline{C_4(0)}$
00010	$-C_4(1)$
<del></del>	<b>::</b>
<del>11101</del>	$\overline{C_4(14)}$
<del>11110</del>	$\frac{C_4(15)}{C_4(15)}$
<del>11111</del>	$\frac{\overline{C_4(15)}}{}$

TFCI is encoded by the (32,10) sub-code of second order Reed-Muller code. The code words of the (32,10) sub-code of second order Reed-Muller code are linear combination of some among 10 basis sequences: all 1's, 5 OVSF codes (C<sub>32,2</sub>, C<sub>32,3</sub>, C<sub>32,5</sub>, C<sub>32,9</sub>, C<sub>32,17</sub>), and 4 masks (Mask1, Mask2, Mask3, Mask4). The 4 mask sequences are as following Table 6.3.1-1.

Mask 1	001010000110001111111000001110111
Mask 2	000000011100110101101101111000111

Mask 3	<u>000010101111110010001101100101011</u>
Mask 4	<u>00011100001101110010111101010001</u>

Table 6.3.1-1. Mask sequences

For information bits  $\underline{a_0}$ ,  $\underline{a_1}$ ,  $\underline{a_2}$ ,  $\underline{a_3}$ ,  $\underline{a_4}$ ,  $\underline{a_5}$ ,  $\underline{a_6}$ ,  $\underline{a_7}$ ,  $\underline{a_8}$ ,  $\underline{a_9}$  ( $\underline{a_0}$  is MSB and  $\underline{a_9}$  is LSB), the encoder structure is as following figure 6.3.1-1.

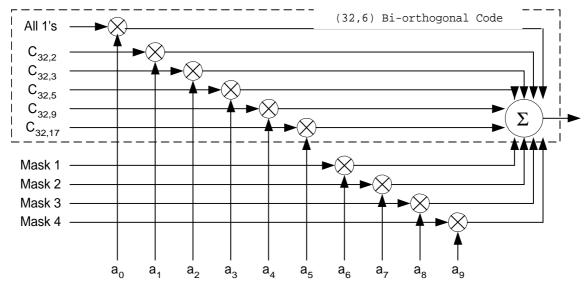

Figure 6.3.1-1. Encoder structure for (32,10) sub-code of second order Reed-Muller code

## 6.3.1.2 Coding of short TFCI lengths

If the number of TFCI bits is 1 or 2, then repetition will be used for coding. In this case each bit is repeated 3 times giving 4-bit transmission for a single TFCI bit and 8-bit transmission for 2 TFCI bits. If the number of TFCI bits is in the range of 3 to 5, then one word of the biorthogonal (16,5) block code, as described in section 6.3.1.2, will be used as follows.

The code words of the biorthogonal (16, 5) code are from two mutually biorthogonal sets,  $S_{C_4} = \{C_4(0), C_4(1), ..., C_4(15)\} \text{ and its binary complement, } \overline{S}_{C_4} = \{\overline{C}_4(0), \overline{C}_4(1), ..., \overline{C}_4(15)\}.$ 

Words of set  $S_{C_4}$  are from the level 4 of the code three, which is generated, using the short code generation method defined in TS 25.223. The mapping of information bits to code words is shown in the Table 6.3.1-2.

Table 6.3.1- 2 Mapping of information bits to code words for biorthogonal (16, 5) code.

Information bits	Code word
00000	$C_4(0)$
00001	$\overline{C_4(0)}$
00010	<u>C</u> <sub>4</sub> (1)
<u></u>	<u></u>
<u>11101</u>	$C_4(14)$

<u>11110</u>	$C_4(15)$
<u>11111</u>	$\overline{C_4(15)}$
