TSG-SA2 would like to inform the relevant WGs of the decision taken in SA2#16 where Visited control option for selection of the S-CSCF & service control in the visited domain for IP MM CN subsystem has been removed from Release 5 architecture. Only the selection of the S-CSCF in the home network's operator (Home control of services) is allowed for Release 5 IP MM CN subsystem. The support of the S-CSCF in the home network only will still allow for access to the "local", non-personalized, services provided in the visited network.

TSG-SA2 would appreciate the co-operation of the WGs to make the necessary adjustments to their relevant standardisation efforts based on this decision. The latest version of the TS 23.228 (v1.6.0 and later) has been updated to reflect the changes based on this decision.

Attached is the latest version of TS 23.228 under development incorporating the changes, which will be the basis for future contributions within SA2.

TSG-SA2 would like to thank the WGs for their support in this matter.
