# Foreword

This Technical Specification has been produced by the 3GPP.

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of this TS, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 Indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the specification;

---

# Introduction

This Technical Specification (TS) is part of a set of TSs which describe the requirements and information necessary for the standardised charging of 3G system.

# 1 Scope

This Technical Specification describes the principles of charging and billing for the provision of service and services by a 3G system.

This standard elaborates on the charging requirements described in the Charging Principles in UMTS 22.101 Service Principles [1]. It allows the generation of accurate charging information to be used in the commercial and contractual relationships between the parties concerned. This standard is not intended to duplicate existing standards or standards being developed by other groups on these topics, and references these where appropriate.

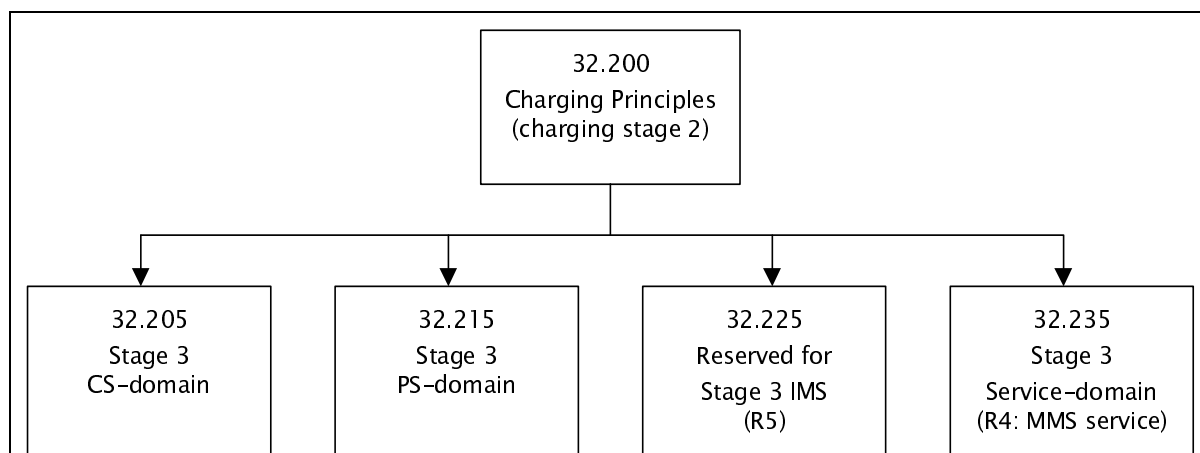

The charging data records (CDRs) generated by the network elements of the 3G network, are required for a number of telecom management activities including, but not limited to, the following:

- the billing of home subscribers, either directly or via service providers, for network utilisation charges;
- the settlement of accounts for traffic carried or services performed by fixed network operators and other operators;
- the settlement of accounts with other PLMNs for roaming traffic via the transferred account procedure;
- statistical analysis of service usage;
- as archival information in dealing with customer service and billing complaints;

In addition to the information collected from network elements, network management functions are required for the administration of charging data.

This document is part of a series of documents specifying charging functionality in UMTS networks. The UMTS charging architecture and principles are specified in the present document which provides an umbrella for other charging documents that specify the structure and content of the CDRs and the interface protocol that is used to transfer them to the collecting node. The CDRs used in the Circuit Switched (CS) domain are specified in document TS 32.205 [5]. The CDRs content and transport within the PS domain are described in TS 32.215 [6] document, while CDRs used for application services are defined in document TS 32.235 [17].

The relationship among these charging specifications is illustrated below.

**Figure 1: Charging Documents Structure**

For the purpose of the present document, the charging data is considered to be generated and collected by charging functions in the network elements.

Charging data fields are collected and CDRs generated by the network elements for transfer to the billing system. For the packet switched domain, the CDRs are first sent to the Charging Gateway Function (CGF) for storage and further processing. The CGF may be a distinct network element or may be integrated into the packet domain network elements themselves.

The objectives of this technical specification are:

- to describe principles of charging in a 3G network;
  - to provide a description of the charging architecture;
- and
- to provide the descriptions of events and triggers for the generation of Charging Data Records (CDRs);

---

## 2 References

The following documents contains provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.
- A non-specific reference to an ETS shall also be taken to refer to later versions published as an EN with the same number.

## 3 Definitions and Abbreviations

### 3.1 Definitions

This section includes definitions specific to the charging functionality or necessary to understand the present specification. Other definitions are specified in TR 21.905 [20].

**(GSM only): a qualifier** indicating that this clause or paragraph applies only to a GSM system. For multi-system cases this is determined by the current serving radio access network.

**(UMTS only): a qualifier** indicating that this clause or paragraph applies only to a UMTS system. For multi-system cases this is determined by the current serving radio access network.

**real time:** Real time charging and billing information is to be generated, processed, and transported to a desired conclusion in less than 1 second.

**near real time:** Near real time charging and billing information is to be generated, processed, and transported to a desired conclusion in less than 1 minute.

**2G- / 3G- :** The prefixes 2G- and 3G- refers to functionality that supports only GSM or UMTS, respectively, e.g., 2G-SGSN refers only to the GSM functionality of an SGSN. When the prefix is omitted, reference is made independently from the GSM or UMTS functionality.

**in GSM,....: a qualifier** indicating that this paragraph applies only to GSM System. For multi system cases this is determined by the current serving radio access network.

**in UMTS,....: a qualifier** indicating that this paragraph applies only to UMTS System. For multi system cases this is determined by the current serving radio access network.

**accounting meter record:** A record containing one or more counters employed to register the usage of resources en masse. Includes simple event counters and/ or cumulative call second counters.

**accounting:** The process of apportioning charges between the Home Environment, Serving Network and User.

**advice of charge:** The real-time display of the network utilisation charges incurred by the Mobile Station. The charges are displayed in the form of charging units. If a unit price is stored by the MS then the display may also include the equivalent charge in the home currency.

**aoc service:** A combination of one or more services, both basic and supplementary, together with a number of other charging relevant parameters to define a customised service for the purpose of advice of charge.

**billing:** A function whereby CDRs generated by the charging function are transformed into bills requiring payment.

**CAMEL:** A network feature that provides the mechanisms to support operator specific services even when roaming outside HPLMN.

**CAMEL subscription information:** Identifies a subscriber as having CAMEL services.

**Charging Data Record (CDR):** A record generated by a network element for the purpose of billing a subscriber for the provided service. It includes fields identifying the user, the session and the network elements as well as information on the network resources and services used to support a subscriber session. In the traditional circuit domain, CDR has been used to denote "Call Detail Record", which is subsumed by "Charging Data Record" hereafter.

**chargeable event:** An activity utilising telecommunications network infrastructure and related services for user to user communication (e.g. a single call, a data communication session or a short message), or for user to network communication (e.g. service profile administration), or for inter-network communication (e.g. transferring calls, signalling, or short messages), or for mobility (e.g. roaming or inter-system handover), which the network operator wants to charge for.

**charged party:** A user involved in a chargeable event who has to pay parts or the whole charges of the chargeable event, or a third party paying the charges caused by one or all users involved in the chargeable event, or a network

operator.

**charging:** A function whereby information related to a chargeable event is formatted and transferred in order to make it possible to determine usage for which the charged party may be billed.

**circuit switched domain:** A domain within UMTS in which information is transferred in circuit mode.

**domain:** Part of a communication network that provides services using a certain technology.

**GPRS:** Packet Services for GSM and UMTS systems.

**inter-system change:** a change of radio access between different radio access technologies such as GSM and UMTS.

**observed IMEI ticket:** A record used to describe an EIR relevant event e.g. a blacklisted IMEI

**packet switched domain:** A domain within UMTS in which data is transferred in packet mode.

**settlement:** Payment of amounts resulting from the accounting process.

**short time:** Time, typically in number of minutes, to perform the off-line mechanism used for accounting.

**successful transaction:** A circuit connection that reaches the communication or data transfer phase e.g. the "answered" state for speech connections. A packet connection that achieves completed data transfer. All other connection attempts are regarded as unsuccessful.

**tariff period:** A part of one (calendar) day during which a particular tariff is applied. Defined by the time at which the period commences (the switch-over time) and the tariff to be applied after switch-over.

**tariff:** A set of parameters defining the network utilisation charges for the use of a particular service.

## 3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

3G	3 <sup>rd</sup> Generation
3GPP	3G Partnership Project
AoC	Advice of Charge
APN	Access Point Name
BMD	Billing Mediation Device
BS	Billing System
CAI	Charge Advice Information
CAMEL	Customised Applications for Mobile network Enhanced Logic
CDR	Charging Data Record
CG	Charging Gateway
CGF	Charging Gateway Function
CI	Cell Identity
CS	Circuit Switched
CUG	Closed User Group
DP	Detection Point
DRP	Data Record Packet
EDP	Event Detection Point
EIR	Equipment Identity Register
EM	Element Management
ETSI	European Telecommunications Standards Institute
FCI	Furnish Charging Information
FTAM	File Transfer, Access and Management
FTP	File Transfer Protocol
G-CDR	GGSN generated- CDR
GGSN	Gateway GPRS Service Node
GMSC	Gateway MSC
GPRS	General Packet Radio Service
gsmSCF	GSM Service Control Function

gsmSSF	GSM Service Switching Function
GSN	GPRS Support Node (either SGSN or GGSN)
GTP	GPRS Tunnelling Protocol
HLR	Home Location Register
HPLMN	Home PLMN
HSCSD	High Speed Circuit Switched Data
ICS	Implementation Conformance Statements
IE	Information Element
IHOSS:OSP	Internet Hosted Octet Stream Service: Octet Stream Protocol
IMEI	International Mobile Equipment Identity
IMSI	International Mobile Subscriber Identity
IP	Internet Protocol
ISDN	Integrated Services Digital Network
ISP	Internal Standardized Profiles
Itf	Interface
ITU-T	International Telecommunication Union - Telecommunications Standardisation Sector
LAC	Location Area Code
LCS	Location Services
M-CDR	Mobility Management generated-Charging Data Record
ME	Mobile Equipment
MMS	Multimedia Messaging Service
MMSE	Multimedia Messaging Service Environment
MGW	Media Gateway
MOC	Mobile Originated Call (attempt)
MS	Mobile Station
MSC	Mobile Services Switching Centre
MSISDN	Mobile Station ISDN number
MSRN	Mobile Station Roaming Number
MTC	Mobile Terminated Call (attempt)
NE	Network Element
NM	Network Management
NMC	Network Management Centre
NSS	Network and Switching Subsystem
OA&M	Operation, Administration and Maintenance
OACSU	Off air call set-up
O-CSI	Originating CAMEL Subscription Information
OMC	Operations and Maintenance Centre
PBX	Private Branch eXchange
PDN	Packet Data Network
PDP	Packet Data Protocol, e.g. IP
PDU	Packet Data Unit
PLMN	Public Land Mobile Network
PPP	Point-to-Point Protocol
PPS	Post-processing system
PS	Packet-Switched
PSPDN	Packet-Switched Public Data Network
PT	Protocol Type (Field in GTP' header)
QoS	Quality of Service
RAB	Radio Access Bearer
RAC	Routing Area Code
RNC	Radio Network Controller
SAC	Service Area Code
S-CDR	SGSN (PDP context) generated – CDR
SCF	Service Control Function
SCI	Subscriber Controlled (MMI) Input
SCS	System Conformance Statement
SGSN	Serving GPRS Service Node
SMF	System Management Function
SMS	Short Message Service

SS7	Signalling System No. 7
S-SMO-CDR	SGSN delivered Short message Mobile Originated – CDR
S-SMT-CDR	SGSN delivered Short message Mobile Terminated – CDR
TAP	Transferred Account Procedure
T-CSI	Terminating CAMEL Subscription Information
TDP	Trigger Detection Point
TID	Tunnel Identifier
TLV	Type, Length, Value (GTP header format)
TMN	Telecommunications Management Network
TS	Technical Specification
TV	Type, Value
UMTS	Universal Mobile Telecommunications System
URA	UTRAN Registration Area
USIM	User Service Identity Module
USSD	Unstructured Supplementary Service Data
UTRAN	UMTS Terrestrial Radio Access Network
VAS	Value Added Service
VLR	Visitor Location Register
VMSC	Visited MSC
VPLMN	Visited PLMN

### 3.3 Symbols

For the purposes of the present document the following symbols apply:

A	Interface between an MSC and a BSC.
Ga	Charging data collection interface between a CDR transmitting unit (e.g. GGSN or SGSN) and a CDR receiving functionality (CGF).
Gb	Interface between an SGSN and a BSC.
Gc	Interface between an GGSN and an HLR.
Gd	Interface between an SMS-GMSC and an SGSN, and between a SMS-IWMSC and an SGSN.
Gf	Interface between an SGSN and an EIR.
Gi	Reference point between the Packet-Switched domain and an external packet data network.
Gn	Interface between two GSNs within the same PLMN.
Gp	Interface between two GSNs in different PLMNs. The Gp interface allows support of Packet-Switched domain services across areas served by the co-operating Packet-Switched domain PLMNs.
Gr	Interface between an SGSN and an HLR.
Gs	Interface between an SGSN and an MSC/VLR.
Iu	Interface between the RNS and the core network. It is also considered as a reference point.
kbit/s	Kilobits per second.
Mbit/s	Megabits per second. 1 Mbit/s = 1 million bits per second.
Mc	Interface between the MGW and (G)MSC server
R	Reference point between a non-ISDN compatible TE and MT. Typically this reference point supports a standard serial interface.
Reporting Area	The service area for which an MS's location shall be reported.

- Service Area** The location accuracy level needed for service management purposes in the 3G-SGSN, e.g. a routing area or a cell. The 3G-SGSN can request the SRNC to report: i) the MS's current service area; ii) when the MS moves into a given service area; or iii) when the MS moves out of a given service area.
- Um** Interface between the Mobile Station (MS) and the GSM fixed network part. The Um interface is the GSM network interface for providing Packet-Switched services over the radio to the MS. The MT part of the MS is used to access the Packet-Switched services in GSM through this interface.
- Uu** Interface between the Mobile Station (MS) and the UMTS fixed network part. The Uu interface is the UMTS network interface for providing Packet-Switched services over the radio to the MS. The MT part of the MS is used to access the Packet-Switched services in UMTS through this interface.

# 4 Architecture

## 4.1 3G logical and charging logical architecture

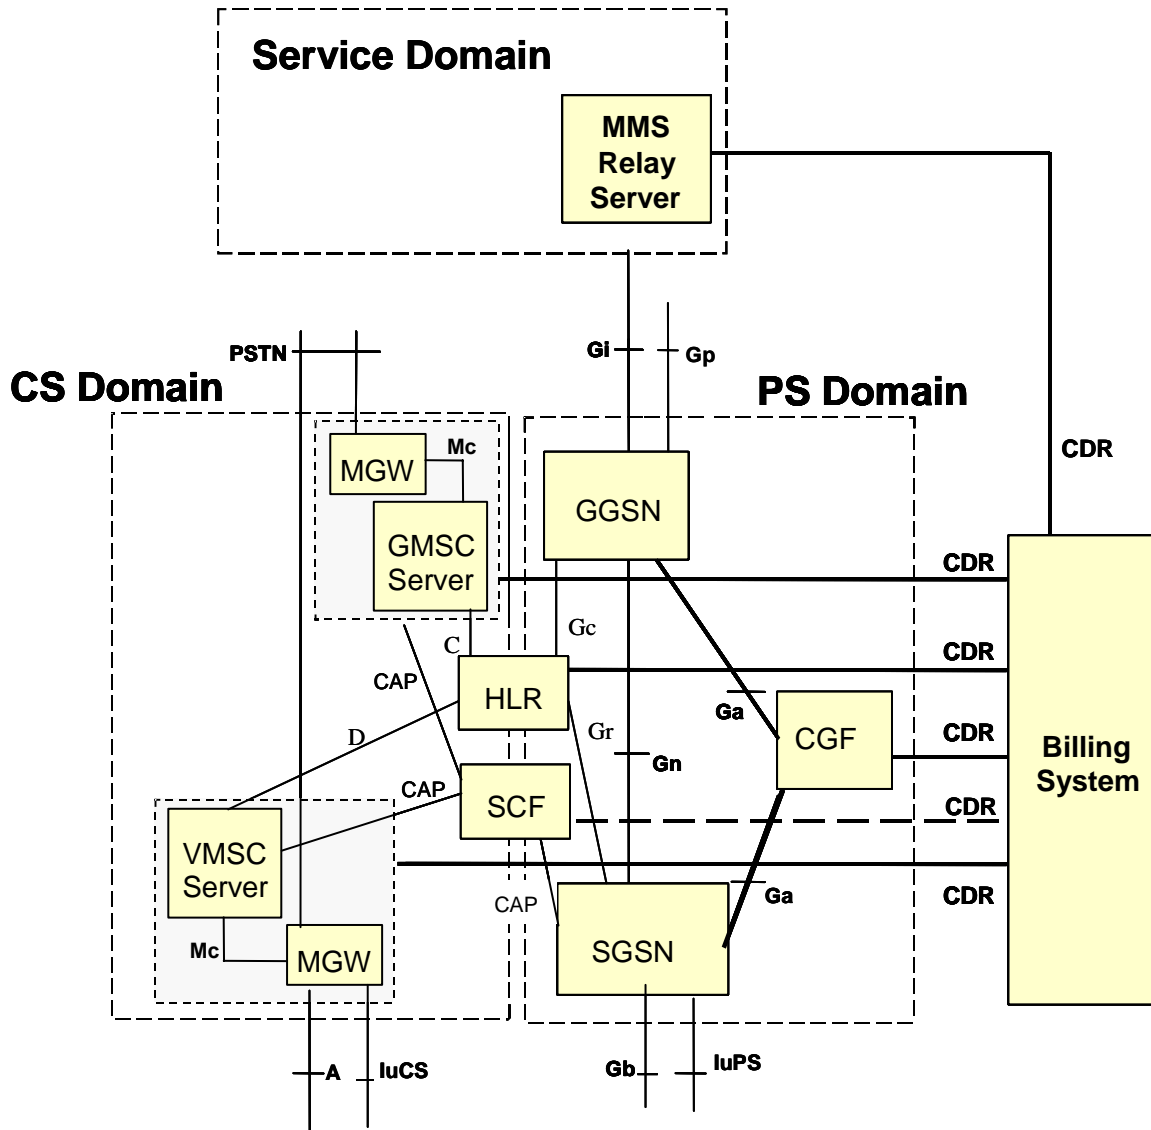

Figure 2 shows the 3G logical architecture for Release 4 as described in TS 23.002. [21]

**Figure 2: Overview of the 3G Logical Architecture**

The 3<sup>rd</sup> Generation Mobile system is logically implemented on the GSM/GPRS structure through the addition of a new air interface supported by two network nodes, the RNC and the Node B. No inference should be drawn about the physical configuration on an interface from Figure 2.

The CAMEL entities are not shown in Figure 2. For the relationship ship of the CAMEL entities to the core network entities illustrated above, refer to TS 23.002 [21].

**Figure 3: 3G charging logical architecture**

Figure 3 illustrates the 3<sup>rd</sup> Generation charging logical architecture, which is subdivided by the two transmission planes, the Circuit Switched (CS) domain and the Packet Switched (PS) domain. The CDRs generated by the serving nodes (SGSN, GGSN) for the appropriate domain are forwarded via the Charging Gateway Function (CGF) entities to the Billing System for processing. Note that the SCF may also transfer CDRs directly to the Billing System. However, the current specifications do not include any CDR descriptions for the SCF. (While not shown explicitly in this figure, the VLR may also generate CDRs.) CDRs for the Multimedia Messaging Service (MMS) are delivered by the MMS Relay/Server when receiving or delivering multimedia messages to the MMS User Agent or to another Multimedia Messaging Service Environment (MMSE). CDRs from the MMS Relay/Server are transferred directly to the Billing System. The CGF has a significant role in the PS domain and is elaborated on in the section 4.2.

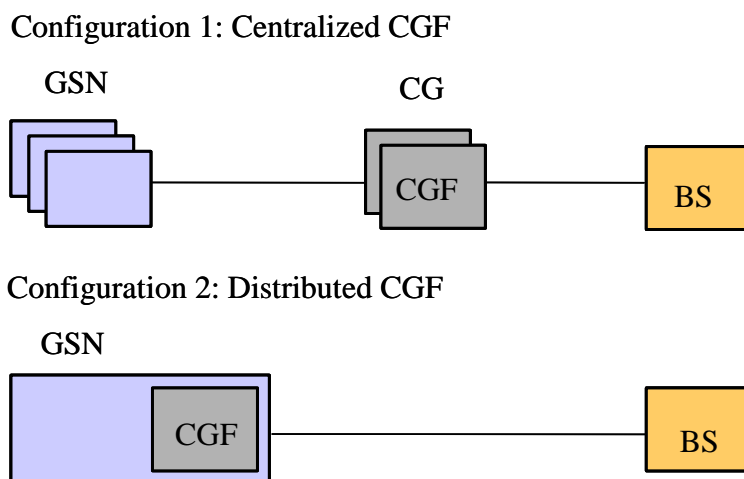

## 4.2 Charging Gateway Function

The Charging Gateway Function (CGF), within the Packet-Switched domain, provides a mechanism to transfer charging information from the SGSN and GGSN nodes to the network operator's chosen Billing Systems. The Charging Gateway

concept enables an operator to have just one logical interface between the CGF and the Billing System. The CGF may be supported in one of the following ways:

- as a centralised separate network element: the Charging Gateway(CG);
- as a distributed functionality resident in the SGSNs and GGSNs.

Support of a centralised or distributed CGF in a network is implementation dependent and subject to vendor/manufacturer agreement. Regardless of the way in which the CGF is supported in the network, the functionality of the CGF is similar. Figure 4 gives an overview of the two basic configurations: In scenario 1, the GSNs support an external interface to the charging gateways they are connected to. In scenario 2, the GSNs support the charging gateway functionality internally.

**Figure 4: Basic architectural scenarios for the CGF location**

If the GSNs with an internal Charging Gateway Function also support the external interface, additional configurations as shown in Figure 5 are possible. In scenario 3, the GSN with integrated Charging Gateway Function also acts as CGF for other GSNs. In scenario 4, the GSN with integrated Charging Gateway Function also supports the transmission of CDRs to external CGFs.

### Configuration 3: Centralized Internal CGF

### Configuration 4: Mixed Internal and External CGFs

**Figure 5: Optional scenarios for the CGF configuration**

The four scenarios in Figure 4 and 5 are not exhaustive.

The CGF provides the mechanism to transfer charging information from the SGSN and GGSN nodes to the network operator's chosen Billing System(s). The main functions of the CGF are:

- the collection of Packet-Switched CDRs from the Packet-Switched nodes generating CDRs;
- intermediate CDR storage buffering;
- the transfer of the CDR data to the billing systems.

The CGF acts as storage buffer for near real-time CDR collection. It provides the CDR data to the billing system. The present document identifies the external interfaces of the CGF, but does not specify the internal functionality of the CGF. However, some of the CGF functionality is described to indicate its behaviour. The CGF may perform specific activities, such as consolidation of CDRs, pre-processing of CDR fields, filtering of un-required CDR fields, and adding of Operator defined fields for specific billing systems. These specific activities may be performed to optimise the charging information that is to be forwarded to the Billing System, which should reduce the load in the Billing System.

The CGF can reside in a separate Network Element, the Charging Gateway(CG) or be integrated in the GSNs. The CGF can receive CDR from the GSNs in near real-time mode. It should have enough storage to enable it to transmit the collected charging data to the Billing System in file mode. The CGF may have to support several transmission protocols towards the Billing System, depending on the Billing System(s) used. One of the purposes of the CG is to reduce the number of different interfaces between the Billing System and the GGSNs and SGSNs sending charging data. If a new Billing System is introduced it shall be interfaced to the CGF, i.e. the protocol stacks and configurations of the GSNs do not need to be updated. The usage and load of mass memory media can be more evenly distributed. The portion of the CGF embedded into a single physical device is called the Charging Gateway entity. The CGF may be distributed to several physical Charging Gateways or GSNs, to facilitate redundancy. If that Charging Gateway entity that is the Primary Charging Gateway entity, does not respond to communication originating from the GSNs, the GSNs will try to send the CDR data to a Secondary Charging Gateway entity. Here each GSN will have several IP addresses (of different priority) for the Charging Gateway entities, thus avoiding downtime of the CGF.

---

## 5 Circuit-Switched Domain

### 5.1 Charging Principles

#### 5.1.1 Requirements according to TS 22.115

The following high-level requirements summarize the more detailed requirements of TS 22.115 [2].

1. to provide a CDR for all charges incurred and requiring settlement between the different commercial roles;
2. to allow itemised billing for all services (including CAMEL) charged to each subscription, including voice and data calls, and services offered by home environments, taking into account:
  - information provided by the user (including authentication parameters, etc.)
  - information provided by the serving network (including Serving Network Id, timestamps, etc.)
  - information provided by the service (including charged party, long calling, multimedia, etc.)
3. to allow fraud control by the Home Environment and the Serving network;

#### 5.1.2 Charging Information

The MSC server and Gateway MSC server are responsible for the collection of all charging relevant information for each MS, PBX and ISUP connection and for the storage of this information in the form of CDRs.

Circuit switched calls can be charged in one MSC server (the anchor MSC server) where all relevant data is available. That is guaranteed by routing all signalling information through the anchor MSC server even if the traffic channel of a call is routed through another MSC server due to handover.

The Gateway MSC server acts as a gateway into other PLMN or fixed networks. Within the PLMN, the GMSC server is responsible for the generation of CDRs for calls routed from or into other networks.

If subscribed-to IN services apply to MS / PBXs the MSC servers contain CAMEL subscription data providing the information required for invocation of the CAMEL dialogues for controlling the MS terminating / PBX incoming and MS originating / PBX outgoing calls. Billing record parameters resulting from the CAMEL treatment applying to MS / PBX calls shall be derived from the MS / PBX's CAMEL subscription data.

In addition to user subscribed services, specific dialled CAMEL services might be invoked which also influence existing records or even trigger the generation of separate records steered by service logic.

In addition to the information collected from these network elements, network management functions are required for the administration of on-line charging data stored in the MSC servers. This data is employed to drive the charge display in the Mobile Station (MS) as required by the advice of charge (AoC) service and defined by TS 22.086 [8] and TS 22.024 [7].

### 5.1.2.1 Subscriber billing

The charging data collected from the HPLMN, interrogating PLMN, and/or VPLMN network elements is employed to determine the network utilisation charges for the basic and supplementary services utilised by the home subscribers of the PLMN. The charges calculated are then combined with the network access (subscription) charges and billed to those customers directly serviced by the PLMN.

For those subscribers handled by Service Providers, the billing information is employed for both wholesale (Network Operator to Service Provider) and retail (Service Provider to Subscriber) billing. Consequently, having been processed by the PLMN Billing System, the charging data collected from the network elements may also be sent to the Service Provider for further processing.

### 5.1.2.2 Settlements of Charges

#### 5.1.2.2.1 Inter-PLMN accounting

Inter-PLMN accounts for roaming traffic are determined in accordance with ITU-T principles (see ITU-T D.93 [18]) and are settled by means of the GSM Association's Transferred Account Procedure (TAP).

#### 5.1.2.2.2 'Visitors' from other PLMNs

The CDRs collected from the network also include details of the services employed by visiting (roaming) subscribers. The charges for mobile originated calls (MOCs) and for supplementary services used are calculated as for home subscribers, converted to an agreed accounting currency and included in the CDRs for the TAP. Even if mobile terminated calls (MTCs) are zero-priced in the visited network (VPLMN), in the absence of 'optimised routing' the MTC TAP records are still required by the home network (HPLMN) in order to determine the re-routing charges from the HPLMN to the VPLMN.

The TAP records generated are exchanged with each HPLMN on a regular basis. These TAP records form the basis of the invoice submitted by the VPLMN for the traffic carried.

#### 5.1.2.2.3 'Home' subscribers roaming in other PLMNs

The HPLMN receives TAP records from each VPLMN for services employed by home subscribers whilst roaming. These records are employed to verify the invoices from the VPLMN and to bill the home subscribers for the services used. The charges contained in the TAP records are converted from the accounting currency to the local currency and a handling surcharge (mark-up) is added if required. The TAP records are subsequently passed to the subscriber billing process described in subclause 5.1.2.1.

#### 5.1.2.2.4 Fixed network operators and other service providers

The settlement of accounts with the operators of fixed networks for traffic carried, is generally performed on a bulk basis according to the principles outlined in the ITU-T D-series recommendations.

The traffic accounted for in this manner may include:

- outgoing (Mobile to Land) traffic;
- incoming (Land to Mobile) traffic;
- transit traffic, carried by intermediate networks;
- signalling (MAP/SCCP, CAP/SCCP) traffic such as location updates.

Accounting information may also be required for the use of services provided by other operators such as short message service centres and other value added service (VAS) providers.

The charges for the various traffic shares may be determined on the basis of the CDRs generated by the network elements or on the basis of bulk counters (accounting meter records) in the gateway MSC servers (GMSC servers). For the purpose of the present document, the management information required is assumed to be derived from CDRs. The management of accounting meters is outside the scope of the present document.

### 5.1.2.3 Service Information

The charging data collected from the network elements may be used to provide statistical information concerning the use of services, by both home and visiting subscribers, within the network. In addition, the introduction of new services and/or modifications to the tariffs of existing services may also require the distribution of the appropriate tariff information to the network elements for Advice of Charge purposes.

## 5.1.3 General Aspects of Charging Data

Charging data record (CDR) generation and contents should be flexible and unnecessary redundancy in data should be avoided. Charging data are collected for successful and selected unsuccessful subscriber transactions. The subscriber transaction is seen as being successful in the MSC server (where the CDR is generated) either if a call is answered or if the Short Message Service Center has confirmed the successful receipt of a mobile originated short message.

Unsuccessful call attempts are recorded in the case of partial record generation due to IN FollowOnCalls. If in such a call constellation the answer state is reached at least once, subsequent unsuccessful set-up of a connection configuration is also recorded in order to provide a complete sequence of FIRST, INTERMEDIATE and LAST records.

Charging data is also collected for supplementary service activity.

At termination of the subscriber transaction these data are formatted into CDRs. These records are forwarded onto MSC server's disk file which constitute the source for further transportation of that data to a Billing System. For the purpose of the present document, the CDRs are considered to be collected, in near real-time, by the following network elements: the MSC servers, MGWs, and location registers.

The data collected by the network elements are sent to, or collected by, the appropriate Billing System for storage and further processing.

Similarly, the tariff data required by the network elements to provide on-line charging information are distributed by the appropriate management system.

## 5.2 Collection of Charging Data Records

### 5.2.1 Charging Data Record Generation

In order to provide the data required for the management activities outlined in the previous chapters (billing, accounting, statistics etc.), the NEF of the MSC server and/or Location Registers shall be able to produce an charging data record for each of the following:

- Mobile originated call attempt;
- Mobile originated emergency call attempt;
- Mobile originated, call forwarding attempt;
- Mobile terminated call attempt;
- Roaming call attempt in a gateway MSC server;
- Incoming call attempt in a gateway MSC server;
- Outgoing call attempt from a gateway MSC server;
- Transit call attempt;
- Terminating CAMEL call attempt;
- Supplementary service actions;
- HLR interrogation;
- Location updating (HLR & VLR);
- Short message service (point-to-point), mobile originated;
- Short message service (point-to-point), mobile terminated;
- Short message service (point-to-point), mobile originated interworking MSC server;
- Short message service (point-to-point), mobile terminated gateway MSC server;
- Common equipment usage.

The purpose of each of these records are described in the following subclauses. A detailed formal description of the data defined in the present document is to be found in TS 32.205 [5].

### 5.2.1.1 AoC service

In addition to the information collected from these Network Elements, network management functions are required for the administration of on-line charging data stored in the MSC server. Two levels of AoC service are available: information level and charging level. The information level is used only to provide AoC information to the user. For the charging level, if no approval of the AoC information by the MS is received in the MSC server, the call is released immediately.

This data is employed to drive the charge display in the Mobile Station (MS) as required by the advice of charge (AoC) service and defined by 3GPP TS 22.086 [8] and 3GPP TS 22.024 [7]. Information used by the AoC service shall include a combination of the following:

- one or more basic services; and/or
- one or more supplementary services; and/or
- one or more network specific services; and/or
- one or more power capability classes (MS classmark); and/or
- the type of radio traffic channel used/ requested;
- the transparency mode of the basic service employed (transparent/non-transparent);
- the type of call or connection (e.g. MOC/ MTC).

This list may also be extended to include additional network specific parameters.

Parameters sent to the mobile station during the operation of the AoC service are recorded in the appropriate CDRs.

### 5.2.1.2 CAMEL services

A CAMEL service can be activated for originating, forwarded and terminated calls and originating SMS. Several fields describing CAMEL subscription and free format data are recorded to appropriate CDR. For originating and forwarded calls two different CAMEL services can be active and part of stored information is different depending on the CAMEL call model and which triggers occur. CAMEL fields describing usage level of service, CAMEL modified parameters and CAMEL initiated call forwarding include information for one call leg including impacts on all CAMEL services.

### 5.2.1.3 Use of supplementary services

The recording of supplementary service usage permits the Billing System (BS) to specify the supplementary service actions (invocation, registration etc.).

In addition to specifying the actions to be recorded, the BS may also determine how these events are to be recorded. Non-call related events, such as the administration of supplementary services by the subscriber via the MMI of the MS, shall result in the production of supplementary service action records. Call related events (e.g. invocation of supplementary services) shall be recorded "in-line" in the appropriate CDR and/ or in a separate SS-action record depending on the configuration specified by the BS.

Where the use of a supplementary service results in the production of further connections (e.g. call forwarding, multi-party service etc.) additional CDRs shall be produced to describe the relevant connections. The use of such services is described in more detail both in this subclause and in the example scenarios.

### 5.2.1.4 Use of call forwarding

When one of the call forwarding services is used, the charging function of the MSC server that forwards the call, shall produce the MOC record for the forwarded part of the call.

For further information concerning the recording of call forwarding services see the example scenarios in section 5.2.2.6 and 5.2.2.7.

### 5.2.1.5 Use of call hold and multi-party services

The use of the call hold service shall be recorded either in-line in the appropriate CDR or in a separate supplementary service "invocation" record as described above. The duration for which the call is held, i.e. is inactive, is not recorded.

The use of the multi-party service requires a minimum of 3 subscribers and the use of a conference circuit. For the purpose of the following description the subscriber invoking the service is referred to as the conference originator ("A") and the conference call is regarded as consisting of a number of individual "legs" between the conference originator and the other parties ("B", "C", etc.) in the call.

Normal MOC and MTC CDRs shall be generated for each party and each leg of the call. In addition, if common equipment records are enabled, a common equipment record shall be produced for the conference originator in order to record the use of a conference bridge and to record the total duration of the conference connection.

**EXAMPLE:** Subscriber "C" calls subscriber "A". Subscriber "A" places the call from "C" on hold and makes a second call to subscriber "B". Subscriber "A" then invokes the multi-party service in order to set-up a conference call with "B" and "C".

Assuming that the appropriate types of record are enabled, the following CDRs shall be produced:

- An MOC record for subscriber "C" and the "C"->"A" leg of the call;
- An MTC record for subscriber "A" and the "C"->"A" leg of the call;
- An MOC record for subscriber "A" and the "A"->"B" leg of the call;
- An SS-Action record for the invocation of the call hold service by subscriber "A";
- An MTC record for subscriber "B" and the "A"->"B" leg of the call;
- An SS-Action record for the invocation of the multi-party service by subscriber "A";
- A common equipment record for the use of the conference bridge by subscriber "A";

Each of the MOC/MTC records for the conference originator ("A") shall include the supplementary service code for the multi-party service.

Any subsequent action affecting only one leg of the connection shall be recorded either in a separate supplementary service action record or in-line in the appropriate CDR. Any action affecting the conference as a whole e.g. the originator holding the conference shall be recorded either in a separate supplementary service action record or in the common equipment usage record.

For further information concerning the recording of multi-party services see the example scenario in section 5.2.2.9.

### 5.2.1.6 Partial records

In order to increase the security of the recording process and to simplify post-processing, it may be desirable to generate a sequence of CDRs to describe a single connection or transaction.

In case of connections of extended duration, the loss of a single CDR may result in an unacceptable loss of revenue. If the connection is, for example, recorded in a number of consecutive partial records generated at say hourly intervals, then the maximum loss of revenue is the equivalent of a one hour continuous connection.

Most modern billing systems employ some form of cumulative credit-limit checking based on the stream of input CDRs. If however, a CDR is only produced at the end of the connection then a subscriber may avoid such credit checking by employing a connection for days, weeks or even months without a single CDR being produced.

All of the records defined in TS 32.205 [5] are of variable length and some at least are potentially unlimited in size (SET OF, SEQUENCE OF etc.). However, the storage capacity of the internal records within the network element is normally subject to strict size limitations. Under such conditions a partial record may be required in order to circumvent internal resource limitations. For example, if an internal MOC record can only support the use of four supplementary service invocations then the use of a fifth may result in the generation of a partial record.

Alternatively, for those manufacturers whose systems are based on fixed length records, partial records may be employed instead of the various lists contained within the present document definitions. In such cases a partial record will be produced each time one of the key fields alters during the connection.

Finally, in case of radio link failure and subsequent call re-establishment partial records shall be generated to record the duration of the call prior to the radio link failure and the subsequent duration of the call once the call has been re-established.

To summarise, the following events may result in the generation of a partial record:

- expiry of the partial record timer;
- change of basic service during a connection;
- change of location (LAC or Cell Id. or the Service Access Code, for UMTS) during a connection;
- change of MS classmark during a connection;
- change of AoC Parameters during a call;
- change of Radio Channel Type (full/half rate) during a call;
- radio link failure and subsequent call re-establishment;
- change of HSCSD Parameters (for GSM only) during a call;
- change of CAMEL destination (CAMEL controlled/initiated) during a call.

All partial records for the same connection shall contain the same call reference and shall be ordered via a running sequence number. The time stamps involved shall apply to the individual partial records rather than the connection as a whole i.e. the "end" time stamp (duration) of one record shall, in general, coincide with the "start" time stamp (answer time) of the next. Each time a new partial record is created the cause for termination field of the previous record shall contain the value "partial record". The cause for termination of the final partial record shall contain the true cause for termination of the connection.

It should be noted that the records produced in case of call re-establishment are not contiguous and that the value of the cause for term field in the record that is closed on radio link failure contains the value "partial record call re-establishment".

The partial records generated may repeat each of the non-varying fields contained in the original record. Alternatively, a form of reduced partial record may be generated which includes only those fields required to identify the original record together with the field(s) that actually change.

#### 5.2.1.7 Use of circuit-switched data services

If data services are employed in conjunction with a Packet-Switched Public Data Network (PSPDN) then an MOC/MTC CDR may be produced in the originating/terminating MSC server and a gateway record in the gateway/interworking MSC server. If the packet volume is not available within the PLMN then this information may also be provided in the form of a CDR from the PSPDN. In such cases the Billing System is responsible for the correlation of the various records describing the connection. The definition of such PSPDN CDRs is outside the scope of the present document.

#### 5.2.1.8 Inter-MSC server handover

In the case of an inter-MSC server handover the controlling MSC server, as defined by TS 23.009 [22], remains in control of the connection and shall therefore, produce the CDR. For the avoidance of doubt, it is not necessary to produce CDRs in the subsequent MSC server(s).

#### 5.2.1.9 Call re-establishment

In case of radio link failure as described in TS 24.008 [9], the MS may attempt to re-establish the call using the procedures described in TS 24.008 [9].

For the time period between the detection of the radio link failure by the mobile station and the successful re-establishment of the call, the advice of charge function in the MS is suspended as described in TS 24.086 [23]. In order to minimise the difference in charges between the on-line calculations performed by the MS and the off-line processing on the basis of the CDRs, it is necessary to exclude the time taken for the re-establishment phase from the chargeable duration stored in the CDRs.

If the re-establishment attempt fails then an ordinary CDR (MOC/MTC) shall be produced with the cause for termination value "stable call abnormal termination". The chargeable duration stored in this record covers the time period from "Answer" to the detection of the radio link failure by the MSC server.

If, the attempt to re-establish the call succeeds then the current CDR shall be closed with the cause for termination value "partial record call re-establishment" and a new partial record shall be opened for the re-established call. The chargeable duration stored in the original record is once again the time period from "answer" to detection of the radio link failure by the MSC server. Both the "seizure" and "answer" times of the subsequent partial record correspond to the time at which the new traffic channel is allocated for the re-established call.

Further radio link failures during the re-established call may result in the generation of additional partial records as described above. All of the partial records belonging to the same connection are identified by the same call reference and a running sequence number.

NOTE: As the MS and MSC server may detect the radio link failure at different points in time, it is not possible to guarantee that the duration used for the AOC display corresponds to that recorded in the CDRs. The purpose of the above procedure is merely to minimise any discrepancies that may occur.

#### 5.2.1.10 Restricted directory numbers

In addition to the information pertaining to the served mobile subscriber (IMSI, MSISDN, etc.), the CDRs defined in the present document also contain the directory numbers of other parties involved in the recorded connections or transactions. In order to comply with data protection legislation, it is necessary to distinguish between those numbers that may be passed on to third parties and those that needs to be handled confidentially. As a result, each of the number fields (e.g. calling/connected number) contains the presentation and screening information defined in both TS 24.008 [9] and ISUP signalling. If this information is supported by the network, then even restricted numbers may be included in the appropriate records and suppressed off-line by the administration or billing system. If this information is not supported then the entire directory number shall be suppressed by the MSC server/VLR.

#### 5.2.1.11 IMEI Observation

In order to provide the data required by the mobile equipment management activities outlined in the previous chapters, the MSC server shall be capable of producing IMEI tickets for each of the following events:

- usage of a blacklisted IMEI;
- usage of a greylisted IMEI;
- usage of an IMEI not found on the white list.

An observed IMEI ticket is generated whenever greylisted, blacklisted or non-whitelisted mobile equipment is detected during an IMEI check. The purpose of the ticket is to link the mobile equipment under observation with its current user (IMSI). The ticket also includes information describing when and where the equipment was used to enable the tracking of such equipment. Finally, if the ticket was triggered by a call attempt, a call reference is provided in order to locate the corresponding CDR.

The IMEI tickets are generated by the MSC server performing the IMEI check.

### 5.2.2 Charging scenarios

This clause contains a number of example scenarios illustrating the purpose and practical usage of the various types of records defined in the previous subclauses. These examples are by no means exhaustive.

For the purpose of these examples, the following assumptions have been made:

- that the MSC server and VLR are co-located;
- that the records are sent to a post-processing system;
- that the generation of all of the record types described in this section has been enabled;
- that the HLR interrogation records are produced in the HLR and not the interrogating MSC server;
- that supplementary service actions are recorded in separate CDRs.

The following conventions have been used for the figures contained within this subclause:

- 1) Network connections and signalling transactions are illustrated by means of solid lines and referenced by number e.g. (1).

- 2) Operation & Maintenance actions, such as the transfer of CDRs, are represented by means of dotted lines and referenced by letter e.g. (A).
- 3) The Billing System has been included in some, but not all, of the examples. The only reason for this decision is to simplify the resulting figures. The presence of a Billing System is assumed even if not explicitly included.

The following examples are included:

- 1) Mobile to Land (outgoing) call;
- 2) Land to Mobile (incoming) call;
- 3) Mobile to Mobile call within the same network;
- 4) Incoming call to a roaming subscriber;
- 5) Incoming call to a PLMN Service Centre;
- 6) Call Forwarding Unconditional;
- 7) Call Forwarding conditional (on Busy);
- 8) Delivery of a Mobile Terminated Short Message;
- 9) Call Hold and Multi-party services;
- 10) Outgoing call handled by CAMEL;
- 11) Incoming call handled by CAMEL without redirection;
- 12) Incoming call to a roaming subscriber handled by CAMEL;
- 13) Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL;
- 14) Incoming call handled by CAMEL without redirection and forwarded early using GSM SS but controlled by CAMEL;
- 15) Incoming call handled by CAMEL without redirection and forwarded late using GSM SS but controlled by CAMEL;
- 16) Early forwarded call controlled by CAMEL;
- 17) Late forwarded call controlled by CAMEL;
- 18) Incoming call handled by CAMEL with redirection imitated by CAMEL feature.
- 19) Incoming call handled by CAMEL in MSC Server without redirection;
- 20) Outgoing call handled by CAMEL Dialed CSI Trigger
- 21) Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL

### 5.2.2.1 Mobile to land (outgoing) call

Figure 6 illustrates a simple outgoing call from a PLMN subscriber "A" to a fixed network subscriber "B" (1).

The originating MSC server (MSC-A) shall generate an MOC record for subscriber "A".

The GMSC server shall create an outgoing gateway record for accounting with the fixed network including details of the point at which the call left the PLMN i.e. the GMSC server id. and outgoing trunk group. This record also includes time stamps to determine both the holding time of the outgoing trunk and the duration of the conversation.

Even if the MSC server and GMSC server are co-located both records shall be produced.

The records generated are subsequently transferred to the Billing System of the PLMN (A).

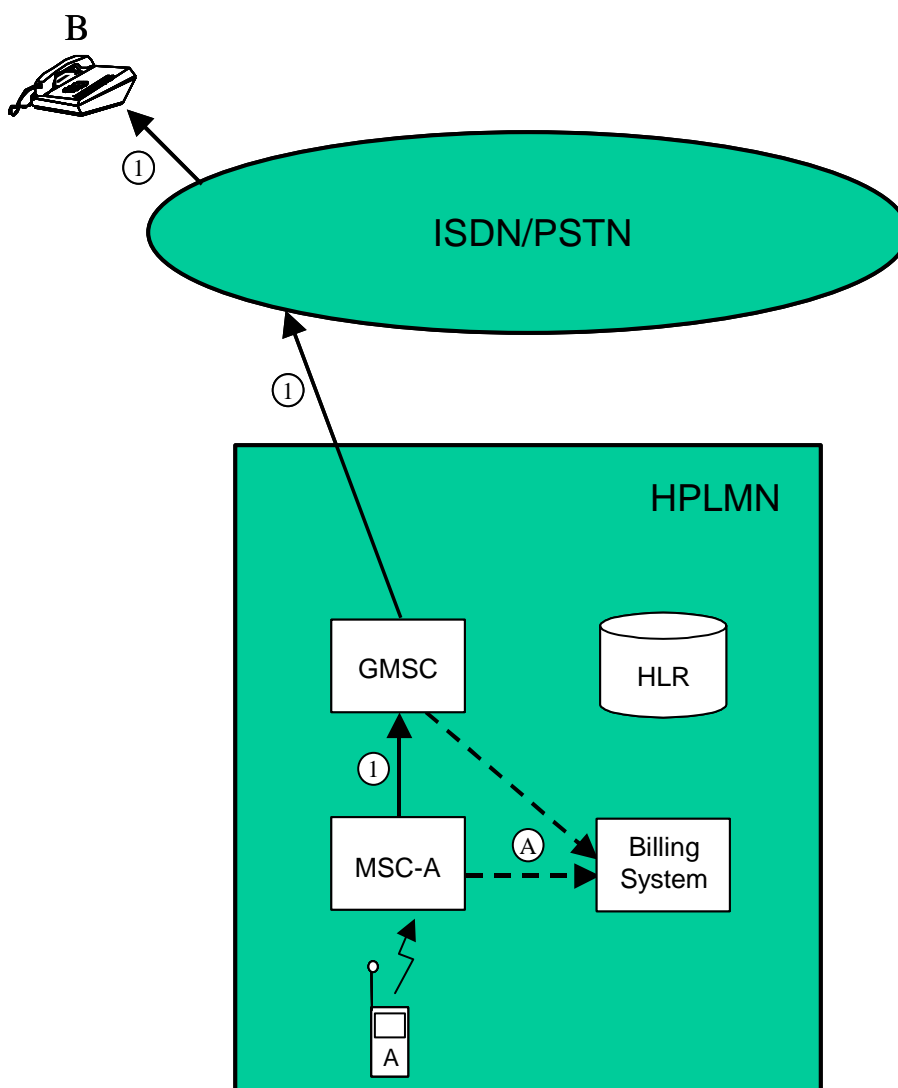

Figure 6: Mobile to land (outgoing) call

### 5.2.2.2 Land to mobile (incoming) call

Figure 7 illustrates a simple incoming call from a fixed network subscriber "A" to a PLMN subscriber "B".

The incoming call is first routed to a GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes to record the point at which the call entered the network together with the time stamps required to calculate the holding time of the incoming trunk and the conversation duration. This gateway record shall contain the IMSI of the called subscriber.

The GMSC server interrogates the HLR of the called subscriber in order to determine his current location (2). The HLR shall create an HLR interrogation CDR.

The GMSC server routes the call to the MSC server at which the subscriber is currently registered (3). This terminating MSC server (MSC-B) shall create an MTC record for subscriber "B".

Even if the MSC server and GMSC server are co-located both the MTC and gateway records shall be produced.

The records generated are subsequently transferred to the Billing System of the PLMN (A).

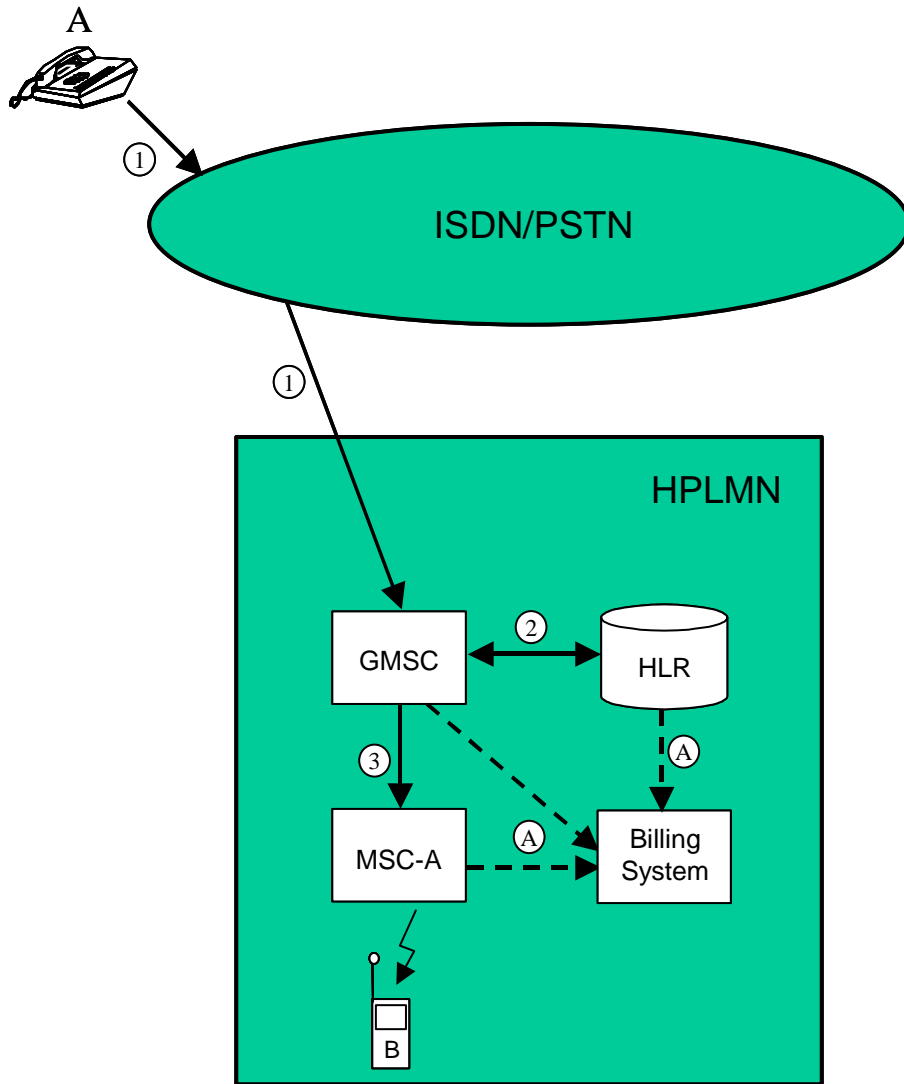

Figure 7: Land to mobile (incoming) call

### 5.2.2.3 Mobile to mobile call within the same network

Figure 8 illustrates a simple mobile to mobile call from subscriber "A" to subscriber "B" both within the same PLMN.

The originating MSC server (MSC-A) shall produce an MOC record for the call to subscriber "B".

Having received a set-up request from subscriber "A" (1), MSC-A interrogates the HLR of the called subscriber in order to determine his current location (2). The HLR shall create an HLR interrogation CDR.

MSC-A routes the call to the MSC server at which subscriber is currently registered (3). This terminating MSC server (MSC-B) shall create an MTC record for subscriber "B". If MSC-A and MSC-B are co-located, then both the MOC and the MTC records shall be produced in the same MSC for this call.

The records generated are subsequently transferred to the Billing System of the PLMN.

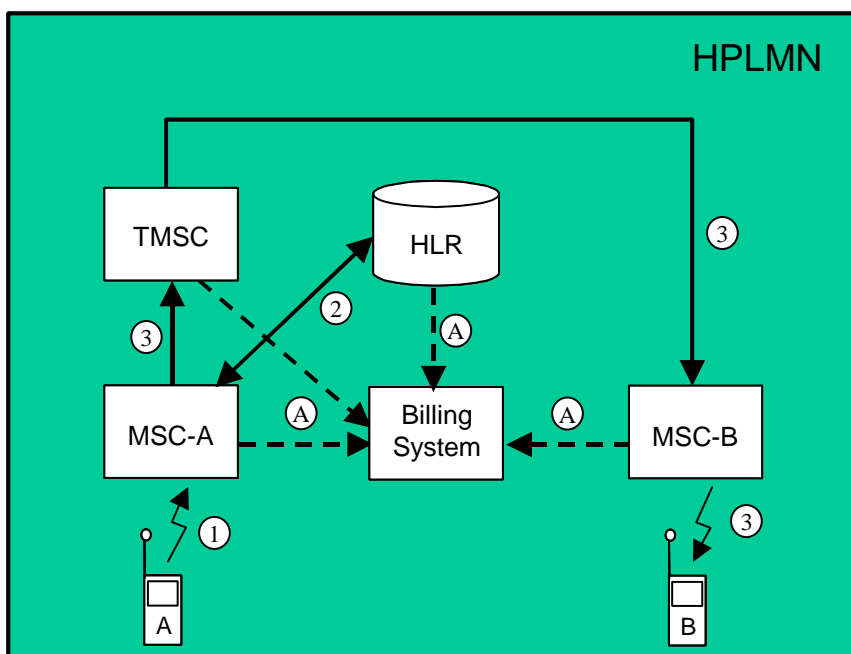

Figure 8: Mobile to mobile call

### 5.2.2.4 Incoming call to a roaming subscriber

Figure 9 illustrates an incoming call from a fixed network subscriber "A" to a PLMN subscriber "B" who is currently roaming in another PLMN.

The call is first routed to a GMSC server (1) and the GMSC server shall create an incoming gateway record for accounting purposes as described in subclause 5.2.2.2. The GMSC server interrogates the HLR of the called subscriber in order to determine his current location (2). The HLR shall create an Interrogation event record.

The GMSC server routes the call to the VPLMN in which subscriber "B" is currently located (3). The GMSC server shall create an outgoing gateway record for accounting purposes. The GMSC server shall also create a roaming record. This record includes the IMSI of the "B" subscriber and may be used as a cross-check for the TAP information received from the VPLMN.

The call is then routed by the VPLMN to the MSC server at which the subscriber is currently located (4). The GMSC server of the VPLMN shall produce an incoming gateway record and the terminating MSC server shall create an MTC record for the call to "B".

The records generated are subsequently transferred to the Billing System of the appropriate PLMN (A). The MTC record generated by the terminating MSC server shall be employed to create the appropriate MTC TAP record. The TAP records shall be included in a TAP file and transmitted to the HPLMN (B).

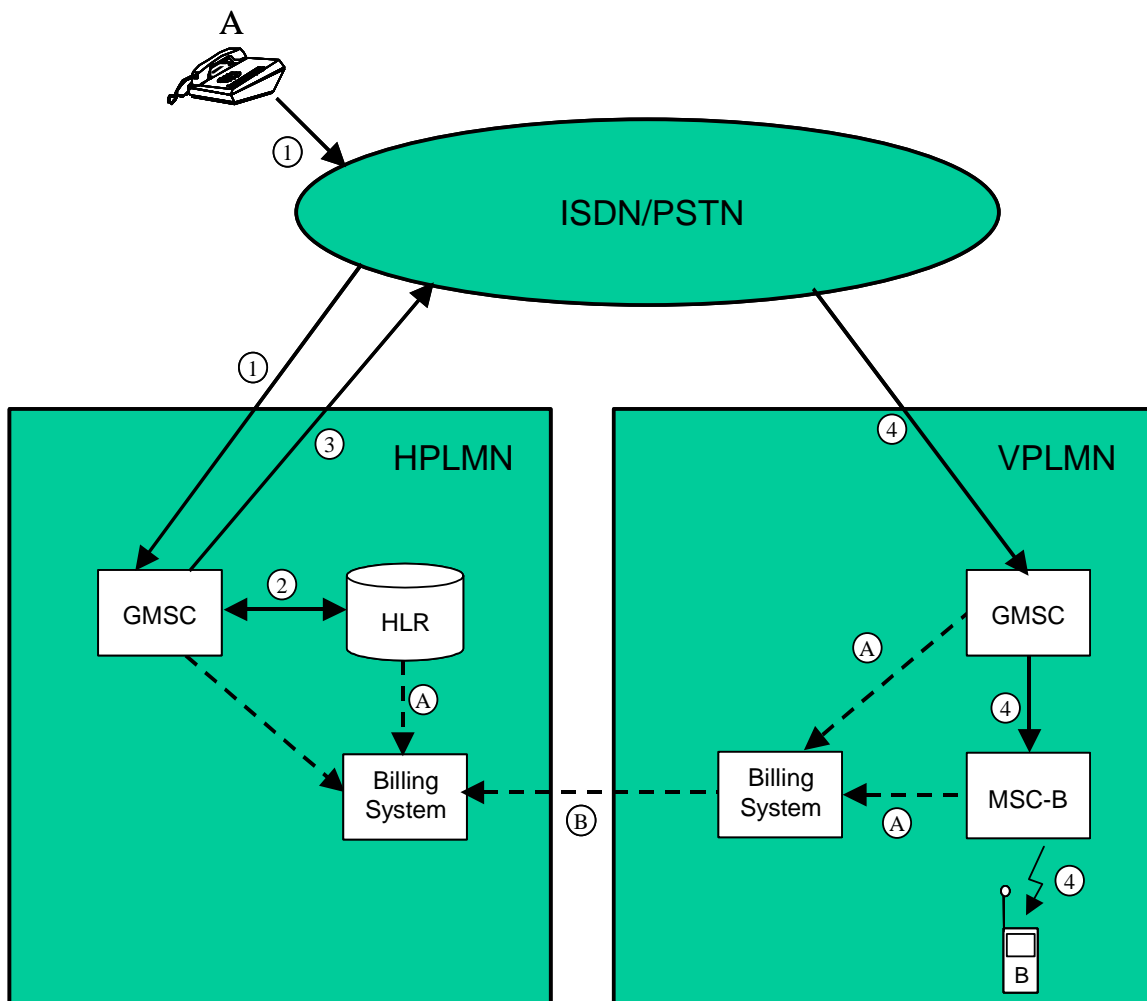

Figure 9: Incoming call to a roaming subscriber

### 5.2.2.5 Incoming call to a PLMN service centre

Figure 10 illustrates an incoming call from a fixed network subscriber "A" to a Service Centre directly connected to an MSC server within a PLMN network. Examples for services provided by such a Service Centre include Voice Mail services, Operator services, etc.

The call is routed to a GMSC server within the PLMN (1). The GMSC server analyzes the dialled digits and routes the call directly to the MSC server to which the Service Centre is connected (2).

As HLR interrogation is not required, there will be no HLR Interrogation record. The GMSC server shall however, create an incoming gateway record based on the point at which the call entered the network and the destination (Service Centre) of the call.

The MSC server then connects the calling subscriber to the service centre. As no mobile subscriber is involved, the MSC server will not create an MTC record, however, the MSC server shall create a transit record describing the destination of the call.

The records generated are subsequently transferred to the Billing System of the PLMN (A).

It should be noted that without the transit record, the MSC server would not generate a record for this connection.

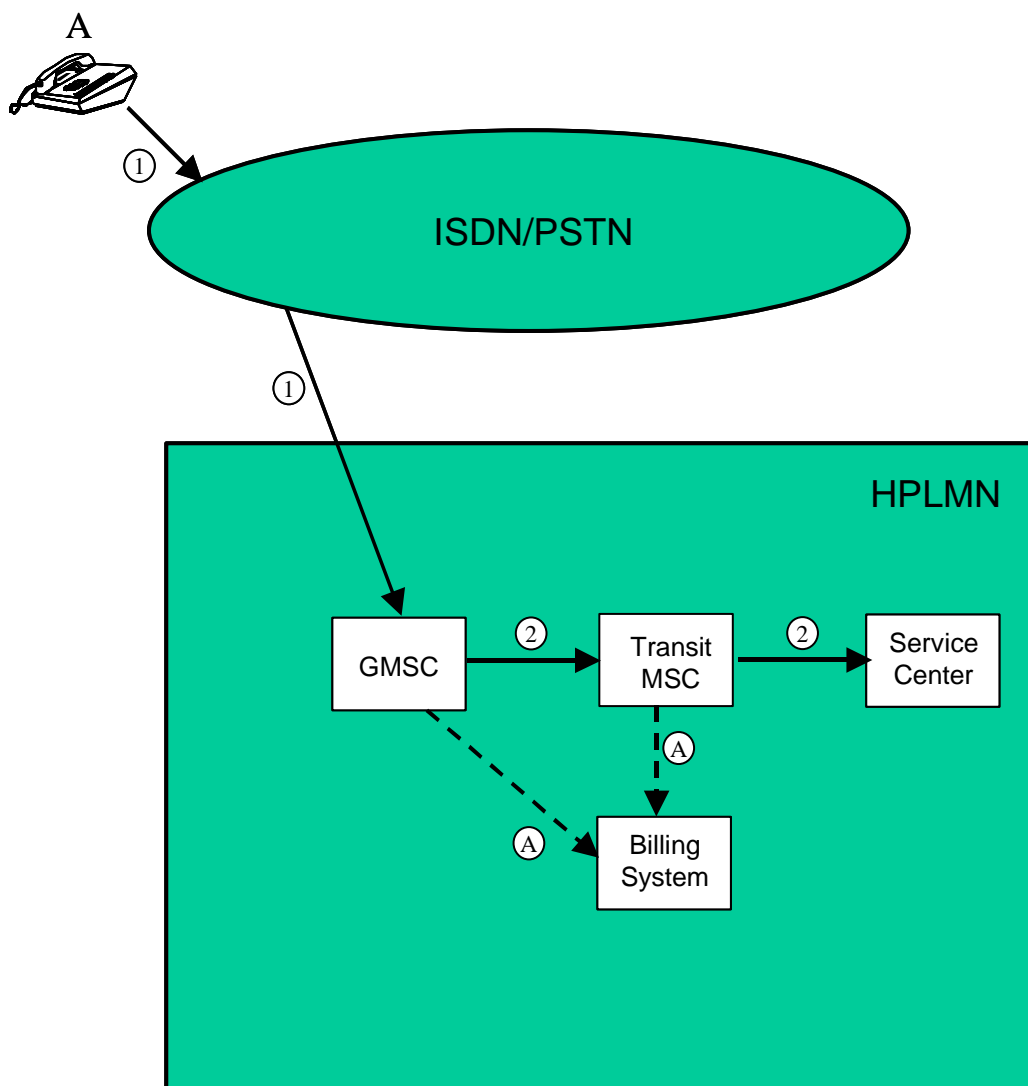

Figure 10: Incoming call to a PLMN service centre

### 5.2.2.6 Call forwarding unconditional

Figure 11 illustrates an incoming call from a fixed network subscriber "A" to a mobile subscriber "B" who has registered and activated Call Forwarding Unconditional (CFU) for the appropriate service. The call is subsequently forwarded to a second fixed network subscriber "C".

For simplicity the registration and activation of CFU have not been included in the diagram. These actions shall of course be recorded in the appropriate supplementary service records.

The incoming call is routed to a GMSC server (1). This part of the connection is identical to the scenario outlined in subclause 5.2.2.2.

The GMSC server interrogates the HLR of the called subscriber in order to determine his current location (2). The HLR shall create an HLR interrogation CDR. The HLR informs the GMSC server that "B" has activated CFU to subscriber "C".

The GMSC server forwards the call to the fixed network subscriber "C" (3). The GMSC server shall create an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". Both records shall contain the supplementary service employed (CFU). The GMSC server shall also produce an outgoing gateway record as described in subclause 5.2.2.1.

The records generated are subsequently transferred to the Billing System of the HPLMN (A).

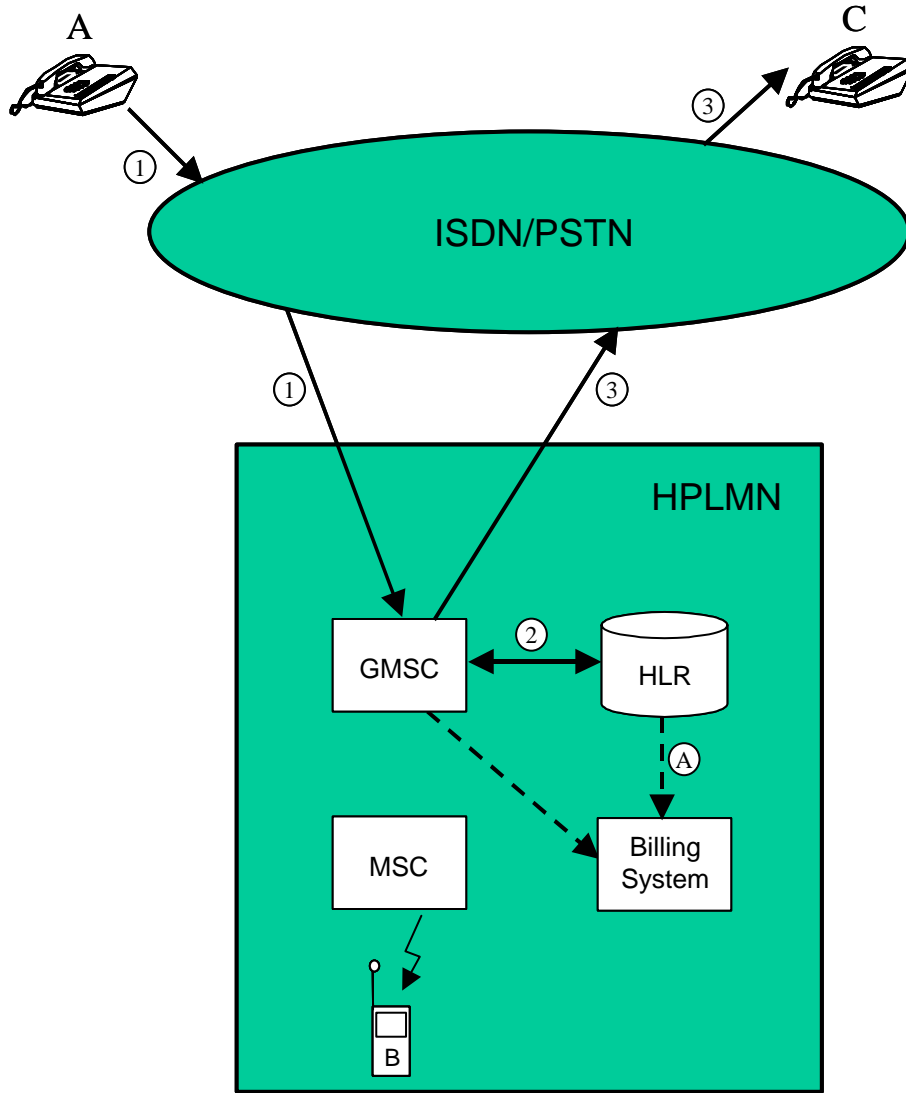

Figure 11: Call forwarding unconditional

### 5.2.2.7 Call forwarding conditional (on busy)

Figure 12 illustrates a mobile originated call from subscriber "A" to a second mobile subscriber "B" who has registered and activated Call Forwarding on Busy (CFB) for the appropriate service. The call is subsequently forwarded to a third mobile subscriber "C". In this example, all three subscribers are currently located within the same (the home) network.

For simplicity the registration and activation of CFB have not been included in the diagram.

Having received a set-up request from subscriber "A" (1), the originating MSC server (MSC-A) interrogates the HLR of subscriber "B" in order to determine his current location (1a). The call is then routed to MSC-B (2).

MSC-A shall create an MOC record for subscriber "A" containing details of the call to "B". The HLR shall produce an HLR interrogation record.

On determining that subscriber "B" is busy and that CFB is active, the forwarding MSC server/VLR (MSC-B) interrogates the HLR of subscriber "C" to determine his current location (2a) and forwards the call accordingly (3).

MSC-B shall produce an MTC record for the "B" subscriber for the call from "A" and an MOC record for the "B" subscriber for the call to "C". Both records shall include the supplementary service employed (CFB). The HLR shall produce an Interrogation record.

The terminating MSC server (MSC-C) shall create a normal MTC record for subscriber "C".

The records generated are subsequently transferred to the Billing System of the PLMN.

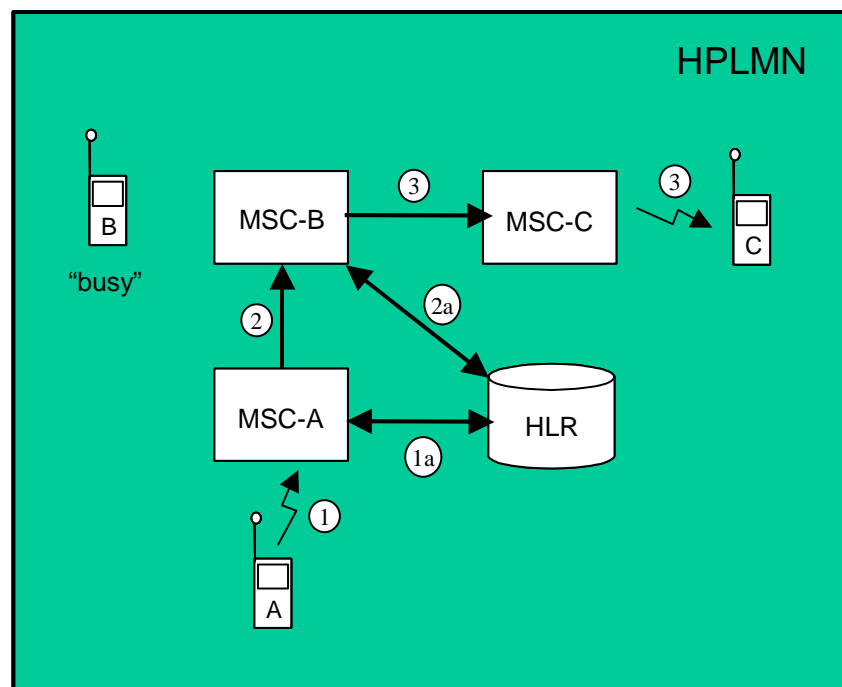

Figure 12: Call forwarding conditional (busy)

### 5.2.2.8 Delivery of a mobile terminated short message

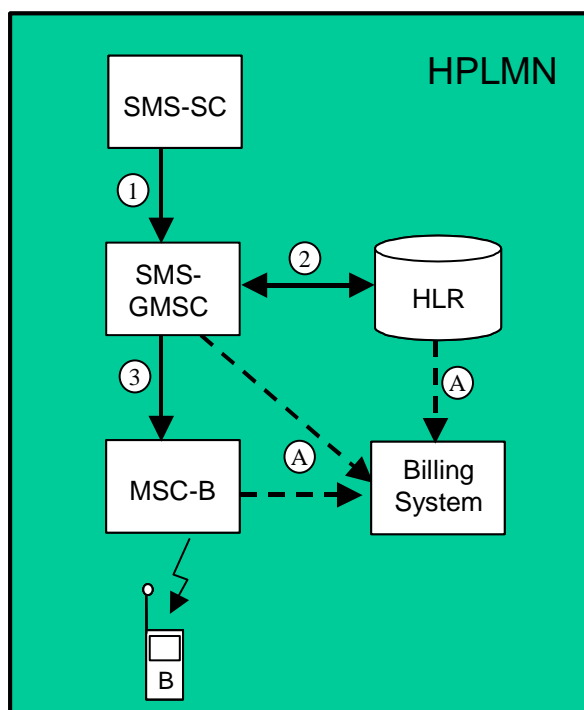

Figure 13 illustrates the delivery of a short message to a mobile subscriber.

The short message service center delivers the message to a GMSC server or gateway function (1). The GMSC server shall create an SMS gateway MT record.

The GMSC server then interrogates the HLR of the subscriber to determine his current location (2). The HLR shall create an HLR interrogation record.

The message is subsequently transmitted to the MSC server serving the mobile subscriber and finally to the mobile station of that subscriber (3). The MSC server shall create an SMS MT record.

The records generated are subsequently transferred to the post-processing system of the HPLMN (A).

**Figure 13: Delivery of a short message to a mobile subscriber**

### 5.2.2.9 Call hold and multi-party service

Figure 14 illustrates the use of the call hold and multi-party services.

A mobile subscriber ("A") sets up an outgoing call (1) to an ISDN subscriber ("B"). This call is recorded as outlined in subclause 5.2.2.1.

Subscriber "A" then invokes the call hold service. MSC-A shall produce a supplementary service action record for the invocation.

Subscriber "A" then sets up a side-call (2) to a second mobile subscriber ("C") within the same network. This call is recorded as outlined in subclause 5.2.2.3.

Subscriber "A" subsequently invokes the multi-party service in order to set up a three-party conference with "B" and "C". MSC-A shall produce a common equipment record for the use of a conference circuit by subscriber "A". This record shall record the duration of the whole conference irrespective of the number of parties subsequently added to, or removed from the conference connection.

Note that the MOC records produced by MSC-A for both the A -> B and A -> C legs of the conference shall contain the supplementary service code for multi-party.

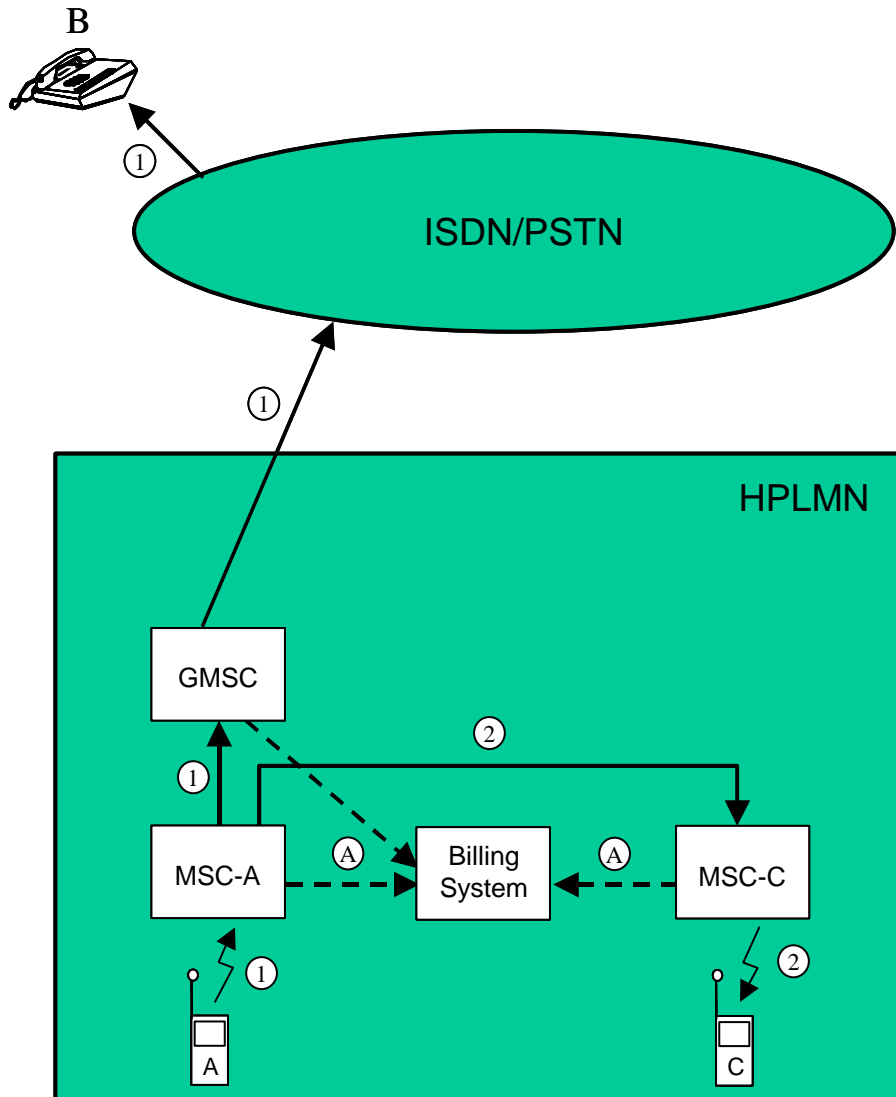

Figure 14: Call hold and multi-party service

### 5.2.2.10 Outgoing call handled by CAMEL

Figure 15 illustrates an outgoing CAMEL call from a mobile CAMEL subscriber "A" to a fixed network subscriber "B" (1).

The "A" subscriber has an active O-CSI (stored in the VLR). Therefore MSC server-A requests instructions from the gsmSSF which passes the CAMEL service key to the gsmSCF to indicate which service logic it should apply (2).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to MSC-A.

MSC server-A generates an MOC record for the "A" subscriber. This record may be linked to an optional SCF-record. The record includes O-CSI data.

The GMSC server routes the call to the "B" subscriber (3). The GMSC server shall create an outgoing gateway record as described in subclause 5.2.2.1.

The generated records are subsequently transferred to the Billing System of the HPLMN (A).

The following records are generated in HPLMN in this call scenario:

**Table 1: Records Generated for an Outgoing Call Handled by CAMEL**

GMSC server	MSC server	HLR
Outgoing gateway record	MOC record	-

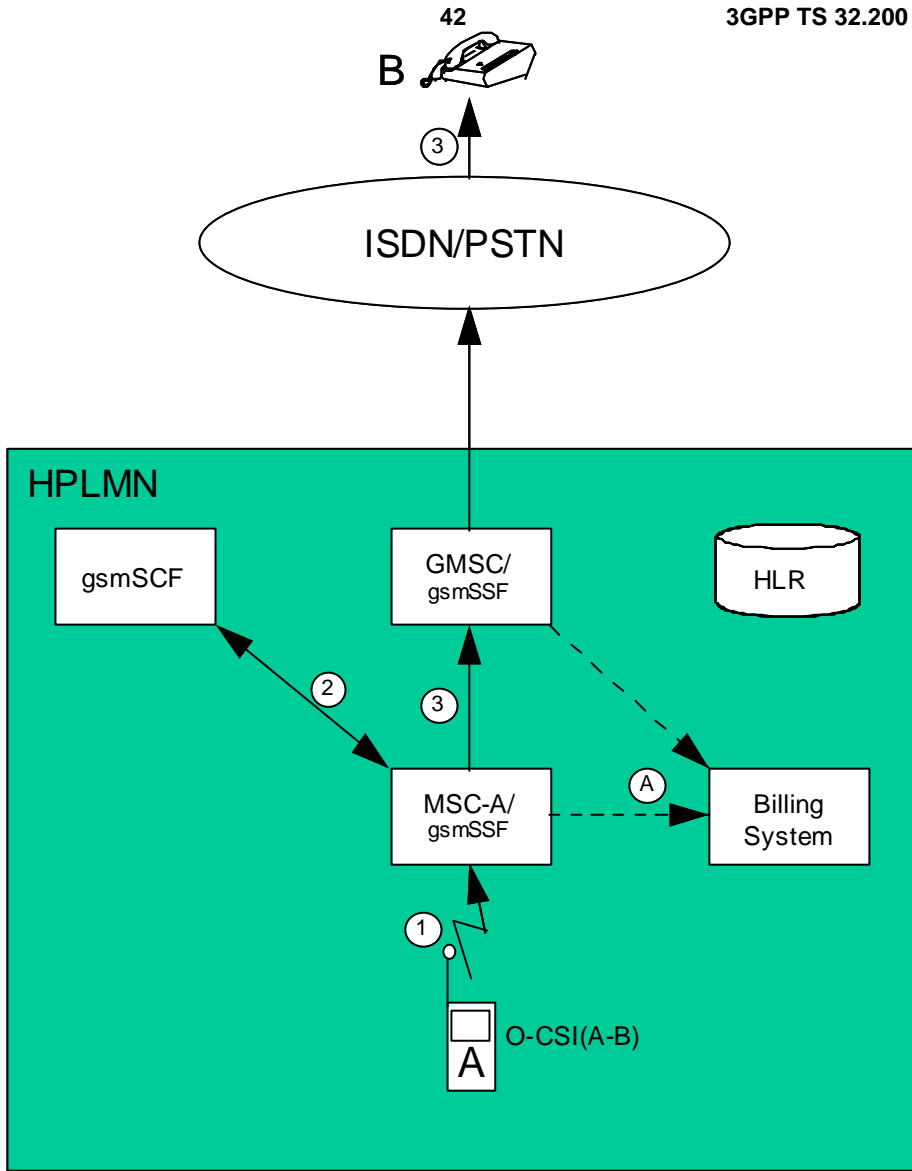

Figure 15: Outgoing call handled by CAMEL

### 5.2.2.11 Incoming call handled by CAMEL without redirection

Figure 16 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B".

The incoming call is first routed to the GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to fetch the T-CSI (2). The HLR shall create an HLR interrogation record.

The "B" subscriber has an active T-CSI. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC server. The GMSC server shall generate a terminating CAMEL record which contains T-CSI data.

The GMSC server interrogates the HLR in order to determine his current location (4). The HLR shall create an HLR interrogation record.

The call is routed to MSC-B (5). An MTC record shall be generated.

For avoidance of doubt, even if the MSC server and GMSC server are co-located both the MTC and gateway records shall be produced.

The generated records are subsequently transferred to the Billing System of the HPLMN (A).

The following records are generated in HPLMN in this call scenario:

**Table 2: Records Generated for an Incoming Call Handled by CAMEL without Re-direction**

GMSC server	MSC server	HLR
Incoming gateway record	MTC record	HLR interrogation record
Terminating CAMEL record		

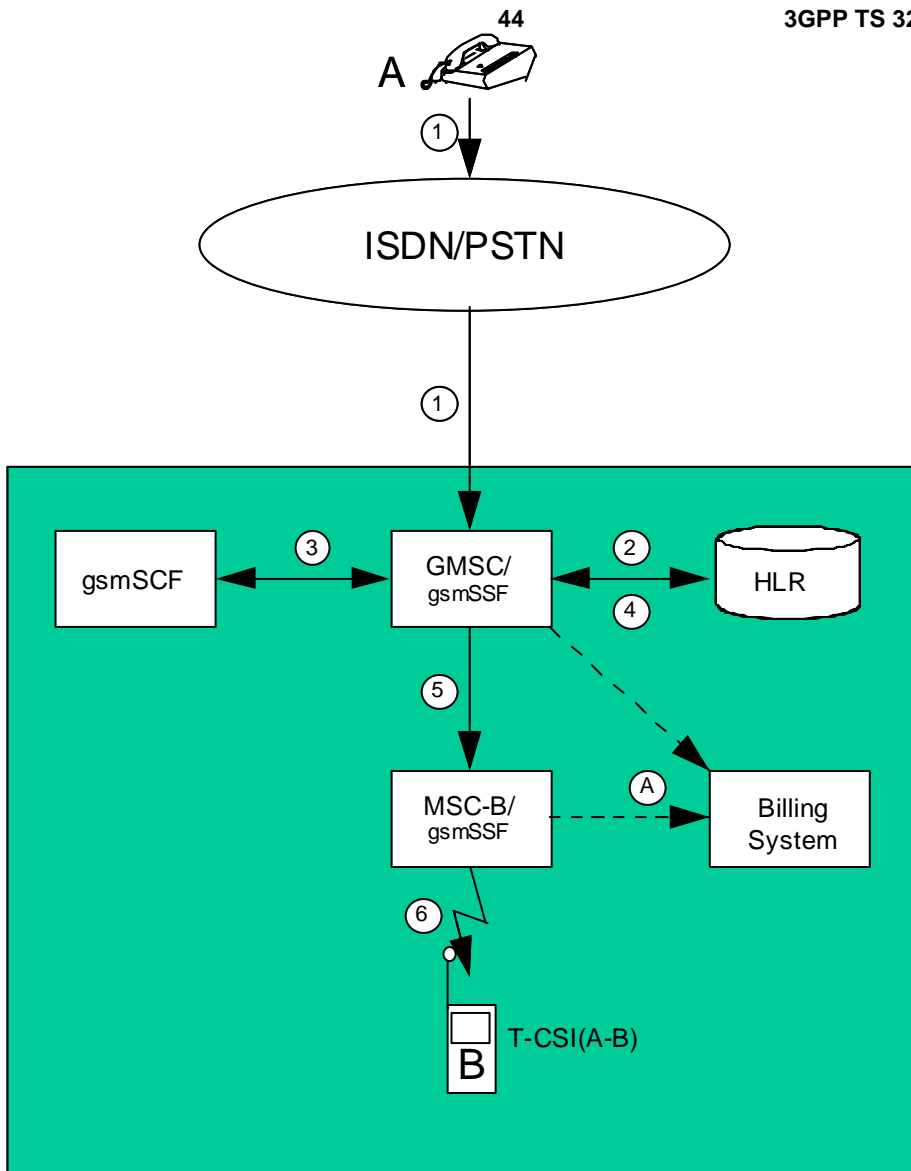

Figure 16: Incoming call handled by CAMEL without redirection

### 5.2.2.12 Incoming call to a roaming subscriber handled by CAMEL

Figure 17 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B" who is currently roaming in another PLMN.

The call is first routed to a GMSC server (1) and the GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to fetch the T-CSI (2). The HLR shall create an HLR interrogation record.

The "B" subscriber has an active T-CSI. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC server. The GMSC server shall generate a terminating CAMEL record which contains T-CSI data.

The GMSC server interrogates the HLR in order to determine his current location (4). The HLR shall create an HLR interrogation record.

The GMSC server routes the call to the VPLMN in which subscriber "B" is currently located (5). The GMSC server shall create an outgoing gateway record for accounting purposes. The GMSC server shall also create a roaming record. This record includes the IMSI of the "B" subscriber and may be used as a cross-check for the TAP information received from the VPLMN.

The call is then routed by the VPLMN to the MSC server at which the subscriber is currently located (6). The GMSC server of the VPLMN shall produce an incoming gateway record and the terminating MSC server shall create an MTC record for the call to "B".

The records generated are subsequently transferred to the Billing System of the appropriate PLMN (A). The MTC record generated by the terminating MSC server shall be employed to create the appropriate MTC TAP record. The TAP records shall be included in a TAP file and transmitted to the HPLMN (B).

The following records are generated in HPLMN in this call scenario:

**Table 3: Records Generated in the HPLMN for an Incoming Call to a Roaming Subscriber Handled by CAMEL**

GMSC server	MSC server	HLR
Incoming gateway record	-	HLR interrogation record
Terminating CAMEL record		
Roaming record		
Outgoing gateway record		

The following records are generated in VPLMN in this call scenario:

**Table 4: Records Generated in the VPLMN for an Incoming Call to a Roaming Subscriber Handled by CAMEL**

GMSC server	MSC server	HLR
Incoming gateway record	MTC record	-

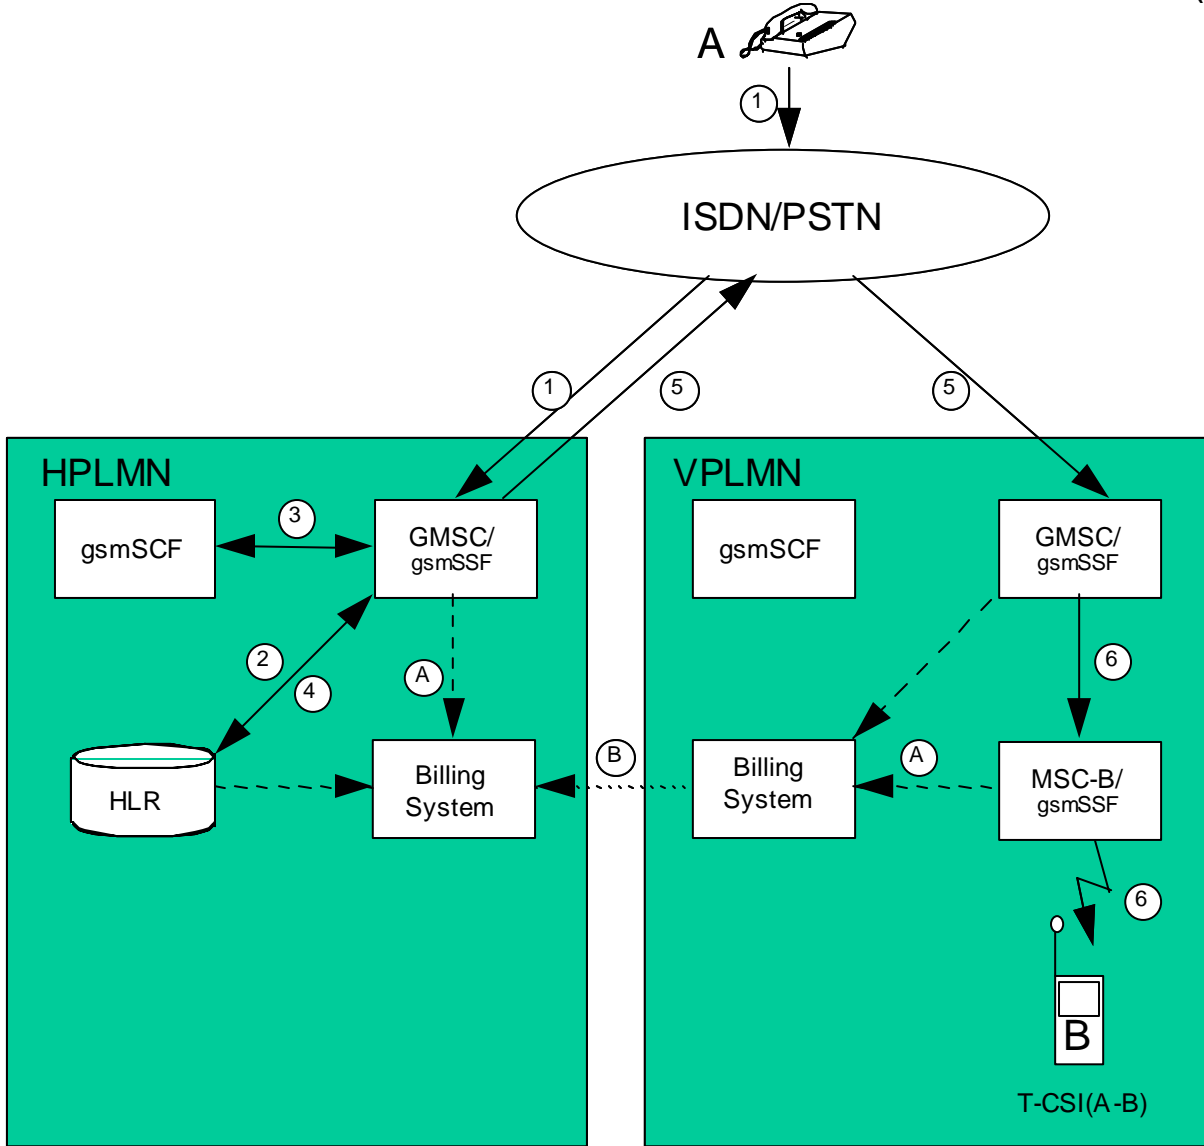

Figure 17: Incoming call to a roaming subscriber handled by CAMEL

### 5.2.2.13 Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL

Figure 18 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B". The call is subsequently forwarded to a second fixed network subscriber "C" by CAMEL initiated Call Forwarding.

The incoming call is routed to the GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to fetch the T-CSI and O-CSI (2).

The "B" subscriber has an active T-CSI. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

The gsmSCF modifies the Called Party number and sets the CAP parameter 'Apply O-CSI'. When gsmSCF processing is complete the call control is returned to the GMSC server. The GMSC server shall generate a terminating CAMEL record which contains T-CSI data.

The "B" subscriber has an active O-CSI. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (4).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC server.

The GMSC server redirects the call to the fixed network subscriber "C" (5). The GMSC server shall generate an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". The MOC record includes O-CSI data and the parameter 'CAMEL initiated CF indicator'. The GMSC server shall also produce an outgoing gateway record as described in subclause 5.2.2.1.

The generated records are subsequently transferred to the Billing System of the HPLMN (A).

The following records are generated in HPLMN in this call scenario:

**Table 5: Records Generated in the Incoming Call with Redirection Decided and Forwarded Leg Handled by CAMEL**

GMSC server	MSC server	HLR
Incoming gateway record	-	HLR interrogation record
Terminating CAMEL record		
MTC record		
MOC (CF) record		
Outgoing gateway record		

Figure 18: Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL

#### 5.2.2.14 Incoming call handled by CAMEL without redirection and forwarded early using GSM SS but controlled by CAMEL

Figure 19 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B". The call is subsequently forwarded to a second fixed network subscriber "C" by GSM SS Call Forwarding Unconditional (CFU) but controlled by CAMEL.

For simplicity the activation and registration of CFU have not been included in the diagram. These actions shall of course be registered in the appropriate supplementary service records.

The incoming call is routed to the GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to fetch the T-CSI and O-CSI (2). The HLR shall create an HLR interrogation record. The HLR informs the GMSC server that "B" has activated CFU.

The "B" subscriber has an active T-CSI. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC server. The GMSC server shall generate a terminating CAMEL interrogation record which contains T-CSI data.

The "B" subscriber has an active O-CSI. Because the "B" subscriber has activated CFU he acts as the originating party for the forwarded leg. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (5).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC server.

The GMSC server redirects the call to the fixed network subscriber "C" (6). The GMSC server shall generate an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". The MOC record includes O-CSI data. The GMSC server shall also produce an outgoing gateway record as described in subclause 5.2.2.1.

If the B-subscriber do not have an active O-CSI the call is forwarded to the "C" subscriber after the first gsmSCF invocation.

The generated records are subsequently transferred to the Billing System of the HPLMN (A).

The following records are generated in HPLMN in this call scenario:

**Table 6: Records Generated in the Incoming call handled by CAMEL without redirection and forwarded early using GSM SS but controlled by CAMEL**

GMSC server	MSC server	HLR
Incoming gateway record	-	HLR interrogation record
Terminating CAMEL record		
MTC record		
MOC (CF) record		
Outgoing gateway record		

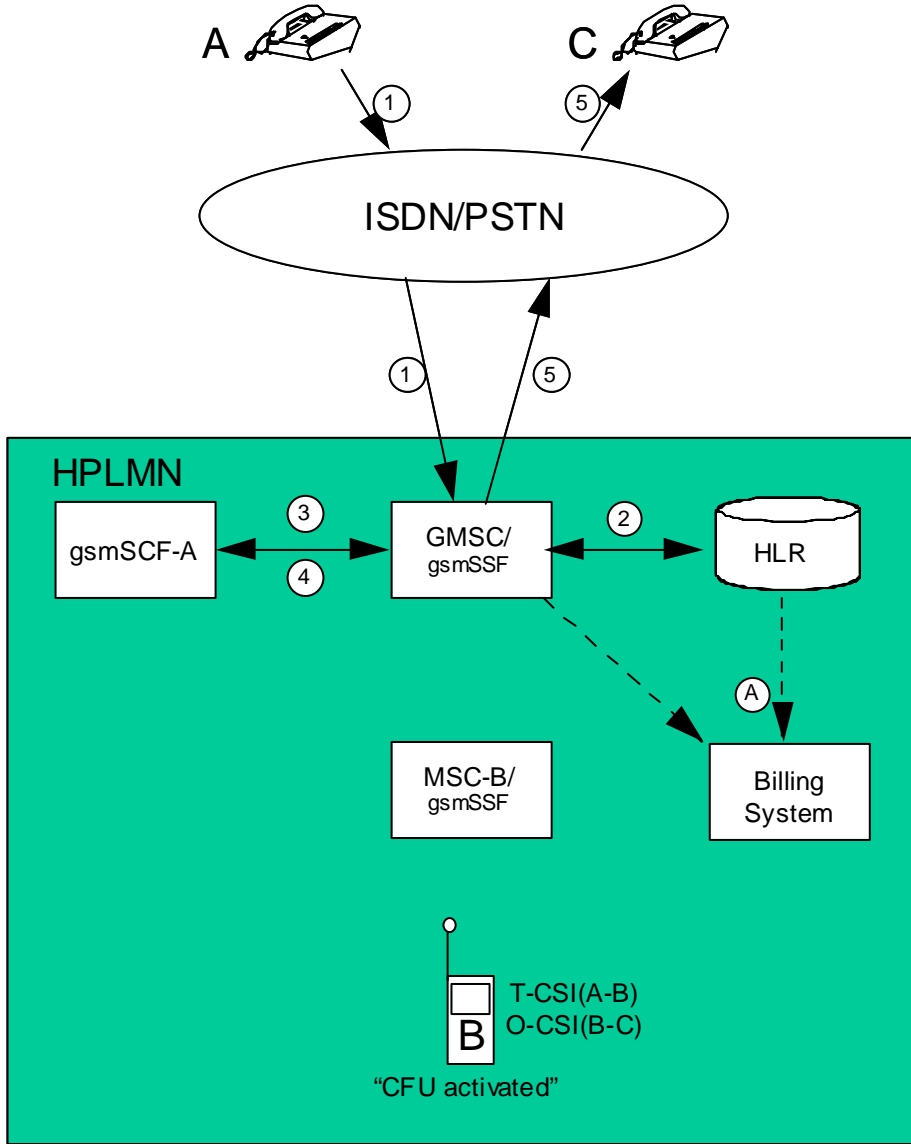

Figure 19: Incoming call handled by CAMEL without redirection and forwarded early using GSM SS but controlled by CAMEL

### 5.2.2.15 Incoming call handled by CAMEL without redirection and forwarded late using GSM SS but controlled by CAMEL

Figure 20 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B" who has registered and activated Call Forwarding on No Reply (CFNRY) for the appropriate service. The call is subsequently forwarded to a second fixed network subscriber "C".

For simplicity the registration and activation of CFNRY have not been included in this diagram. These actions shall be recorded in the appropriate supplementary service records.

The incoming call is routed to the GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to fetch the T-CSI and O-CSI (2). The HLR shall create an HLR interrogation record.

The "B" subscriber has an active T-CSI. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to the gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC server. The GMSC server shall generate a terminating CAMEL interrogation record which contains T-CSI data.

The GMSC server interrogates the HLR in order to determine his current location (4). The HLR shall create an HLR interrogation record.

The call is routed to MSC-B (5). The "B" subscriber do not answer the call. MSC-B shall produce an MTC record for the "B" subscriber for the call from "A".

The "B" subscriber has an active O-CSI. Because the "B" subscriber has activated CFNRY he acts as the originating party for the forwarded leg. Therefore MSC-B requests instructions from the gsmSSF which passes the CAMEL service key to the gsmSCF to indicate which service logic it should apply (6).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to MSC-B.

MSC-B forwards the call via the GMSC server to the "C" subscriber (7). MSC-B shall produce an MOC (call forwarding) for the "B" subscriber for the call to "C". The record includes O-CSI data. The GMSC server shall also produce an outgoing gateway record as described in subclause 5.2.2.1.

If the B-subscriber do not have an active O-CSI the call is forwarded to the "C" subscriber after detecting the call forwarding condition.

The generated records are subsequently transferred to the Billing System of the HPLMN (A).

The following records are generated in HPLMN in this call scenario:

**Table 7: Records Generated in the Incoming call handled by CAMEL without redirection and forwarded late using GSM SS but controlled by CAMEL**

GMSC server	MSC server	HLR
Incoming gateway record	MTC record	-
Terminating CAMEL record	MOC (CF) record	
Outgoing gateway record		

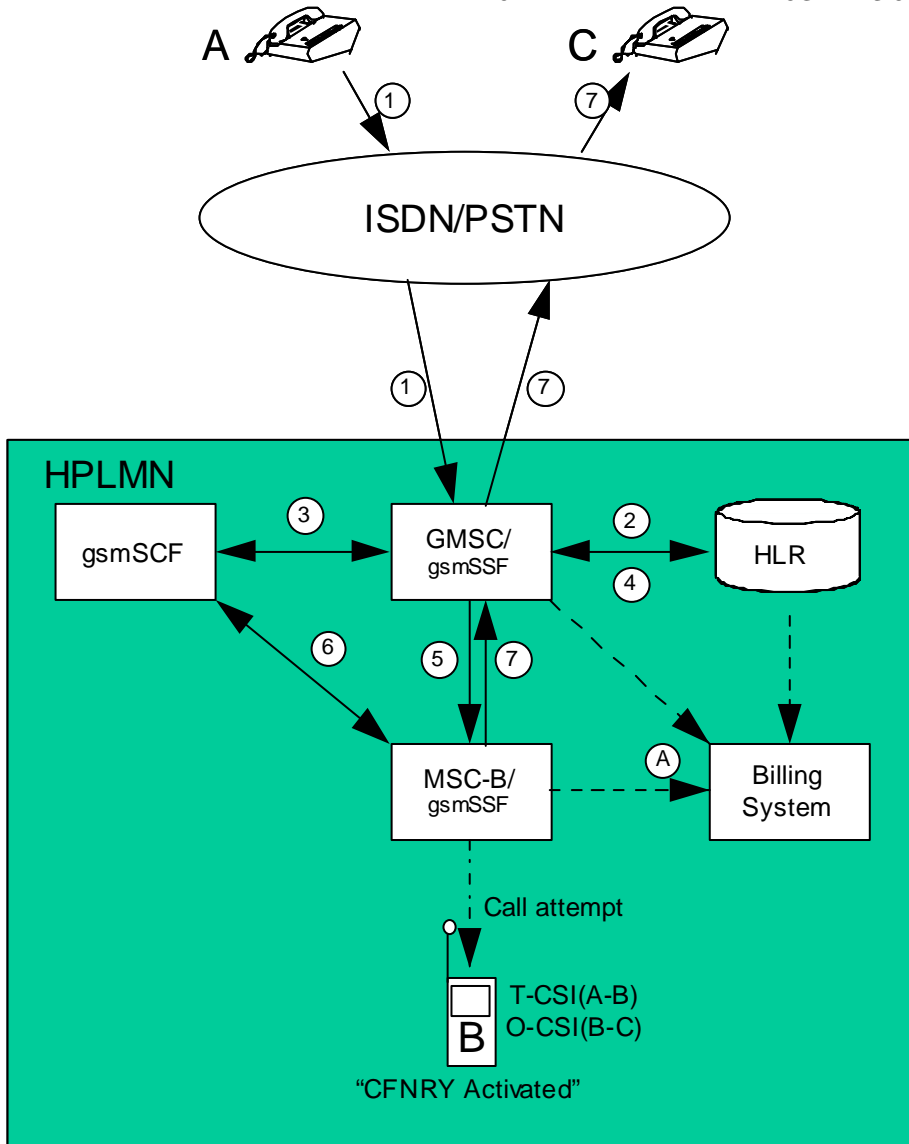

Figure 20: Incoming call handled by CAMEL without redirection and forwarded late using GSM SS but controlled by CAMEL

### 5.2.2.16 Early forwarded call controlled by CAMEL

Figure 21 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B". The call is subsequently forwarded to a second fixed network subscriber "C" by GSM SS Call Forwarding Unconditional (CFU) but controlled by CAMEL.

For simplicity the activation and registration of CFU have not been included in the diagram. These actions shall of course be registered in the appropriate supplementary service records.

The incoming call is routed to the GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to fetch the O-CSI (2). The HLR shall create an HLR interrogation record. The HLR informs the GMSC server that "B" has activated CFU.

The "B" subscriber has an active O-CSI. Because the "B" subscriber has activated CFU he acts as the originating party for the forwarded leg. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC server.

The GMSC server redirects the call to the fixed network subscriber "C" (5). The GMSC server shall generate an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". The MOC record includes O-CSI data. The GMSC server shall also produce an outgoing gateway record as described in subclause 5.2.2.1.

The generated records are subsequently transferred to the Billing System of the HPLMN (A).

The following records are generated in HPLMN in this call scenario:

**Table 8: Records Generated in the Early forwarded call controlled by CAMEL**

GMSC server	MSC server	HLR
Incoming gateway record	-	HLR interrogation record
MTC record		
MOC (CF) record		
Outgoing gateway record		

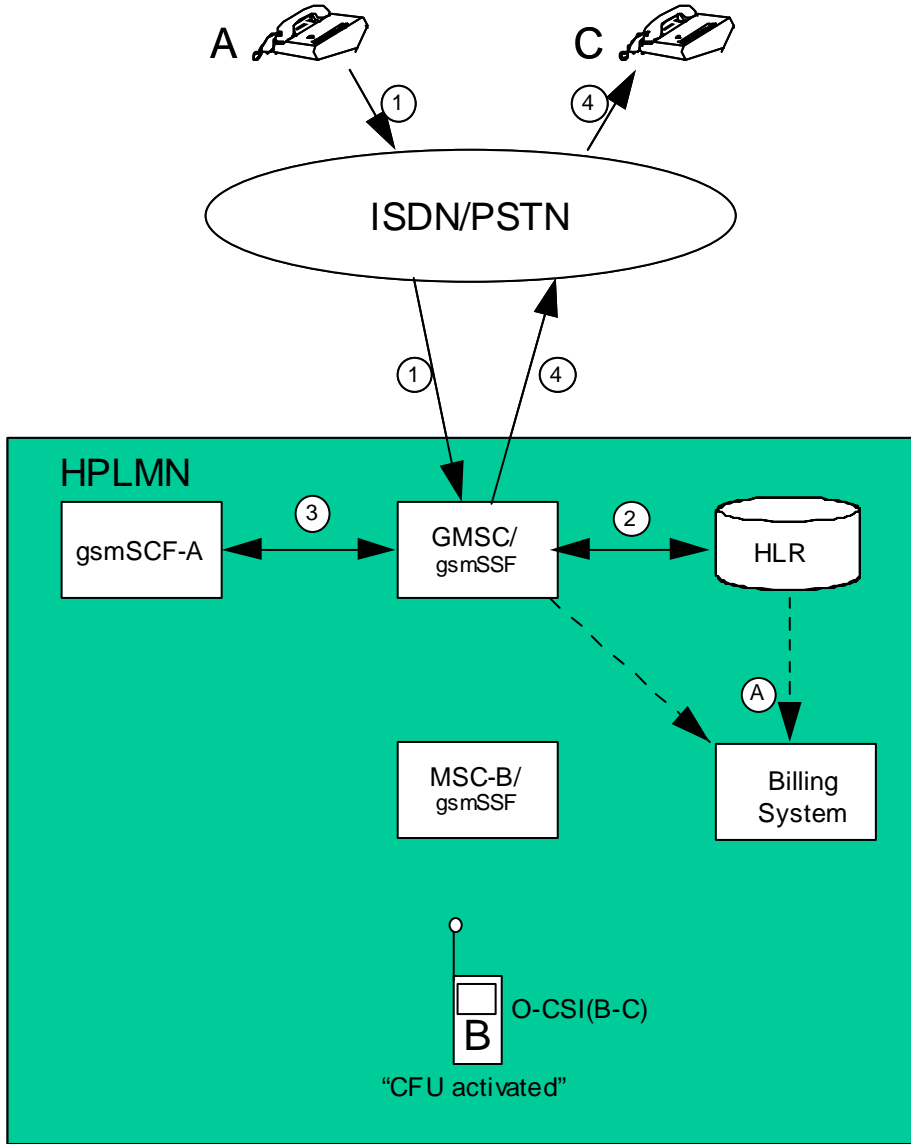

Figure 21: Early forwarded call controlled by CAMEL

### 5.2.2.17 Late forwarded call controlled by CAMEL

Figure 22 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B" who has registered and activated Call Forwarding on No Reply (CFNRY) for the appropriate service. The call is subsequently forwarded to a second fixed network subscriber "C".

For simplicity the registration and activation of CFNRY have not been included in this diagram. These actions shall be recorded in the appropriate supplementary service records.

The incoming call is routed to the GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to determine the current location (2). The HLR shall create an HLR interrogation record.

The call is routed to MSC-B (3). The "B" subscriber do not answer the call. MSC-B shall produce an MTC record for the "B" subscriber for the call from "A".

The "B" subscriber has an active O-CSI. Because the "B" subscriber has activated CFNRY he acts as the originating party for the forwarded leg. Therefore MSC-B requests instructions from the gsmSSF which passes the CAMEL service key to gsmSCF-B to indicate which service logic it should apply (4).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to MSC-B.

MSC-B forwards the call via the GMSC server to the "C" subscriber (5). MSC-B shall produce an MOC (call forwarding) for the "B" subscriber for the call to "C". The record includes O-CSI data. The GMSC server shall also produce an outgoing gateway record as described in subclause 5.2.2.1.

The generated records are subsequently transferred to the Billing System of the HPLMN (A).

The following records are generated in HPLMN in this call scenario:

**Table 9: Records Generated in the Late forwarded call controlled by CAMEL**

GMSC server	MSC server	HLR
Incoming gateway record	MTC record	HLR interrogation record
Outgoing gateway record	MOC (CF) record	

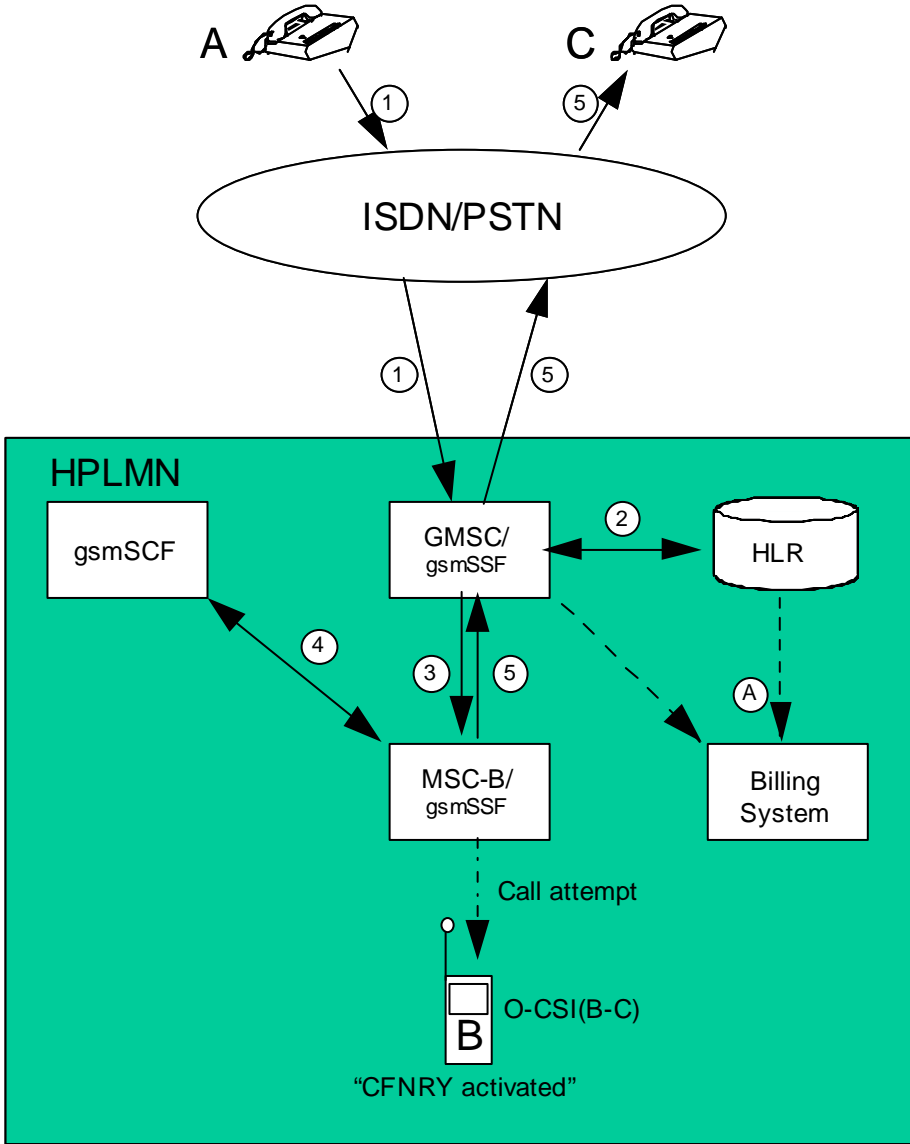

Figure 22: Late forwarded call controlled by CAMEL

### 5.2.2.18 Incoming call handled by CAMEL with redirection initiated by CAMEL feature

Figure 23 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B". The call is subsequently redirected to a second fixed network subscriber "C" by CAMEL initiated redirection.

The incoming call is routed to the GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to fetch the T-CSI (2) and the O-CSI (2). The HLR shall create an HLR interrogation record.

Since subscriber "B" has an active T-CSI and the trigger criteria are met the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3). A terminating CAMEL interrogation record is generated in the GMSC server for invoking the terminating CAMEL call handling.

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

The gsmSCF returns a modified destination routing address to the GMSC server (without the option "apply O-CSI"). Therefore for the redirection leg (B-C) the CAMEL feature is not invoked.

The GMSC server redirects the call to the fixed network subscriber "C" (4). For fixed network accounting purposes the GMSC server shall generate an outgoing gateway record as described in subclause 5.2.2.1.

The generated records are subsequently transferred to the Billing System of the HPLMN (A).

The following records are generated in HPLMN in this call scenario:

**Table 10: Records Generated in the Incoming call handled by CAMEL with redirection initiated by CAMEL feature**

GMSC server	MSC server	HLR
Incoming gateway record		HLR interrogation record
Terminating CAMEL interrogation record		
Outgoing gateway record		

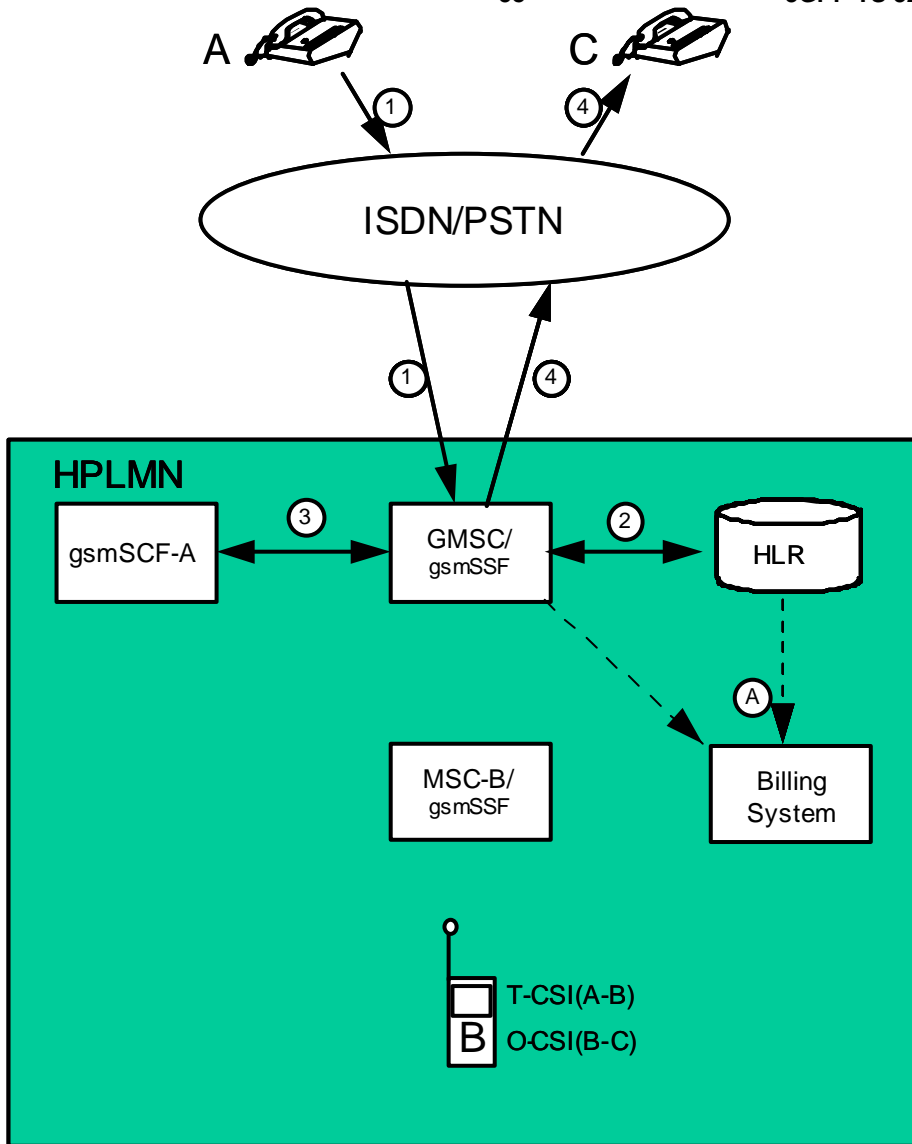

Figure 23: Incoming call handled by CAMEL with redirection initiated and by CAMEL feature

### 5.2.2.19 CAMEL Scenario for Visiting Terminator Trigger Calls

Figure 24 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B".

The incoming call is first routed to the GMSC (1). The GMSC shall create an incoming gateway record for fixed network accounting purposes.

The GMSC interrogates the HLR (2) of the called subscriber. The HLR shall create an HLR interrogation record. The call is routed to MSC-B(3). An MTC record shall be generated in MSC-B.

The "B" subscriber has an active VT-CSI (stored in the VLR). For avoidance of doubt in this scenario, the "B" subscriber does not have an active T-CSI in the HLR. Therefore MSC-B requests instructions from the gsmSSF which passes the CAMEL service key to the gsmSCF to indicate which service logic it should apply (4).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the MSC-B. The MSC-B shall generate a terminating CAMEL (TCR) record which contains VT-CSI data.

The MSC-B routes the call to the "B" subscriber (5).

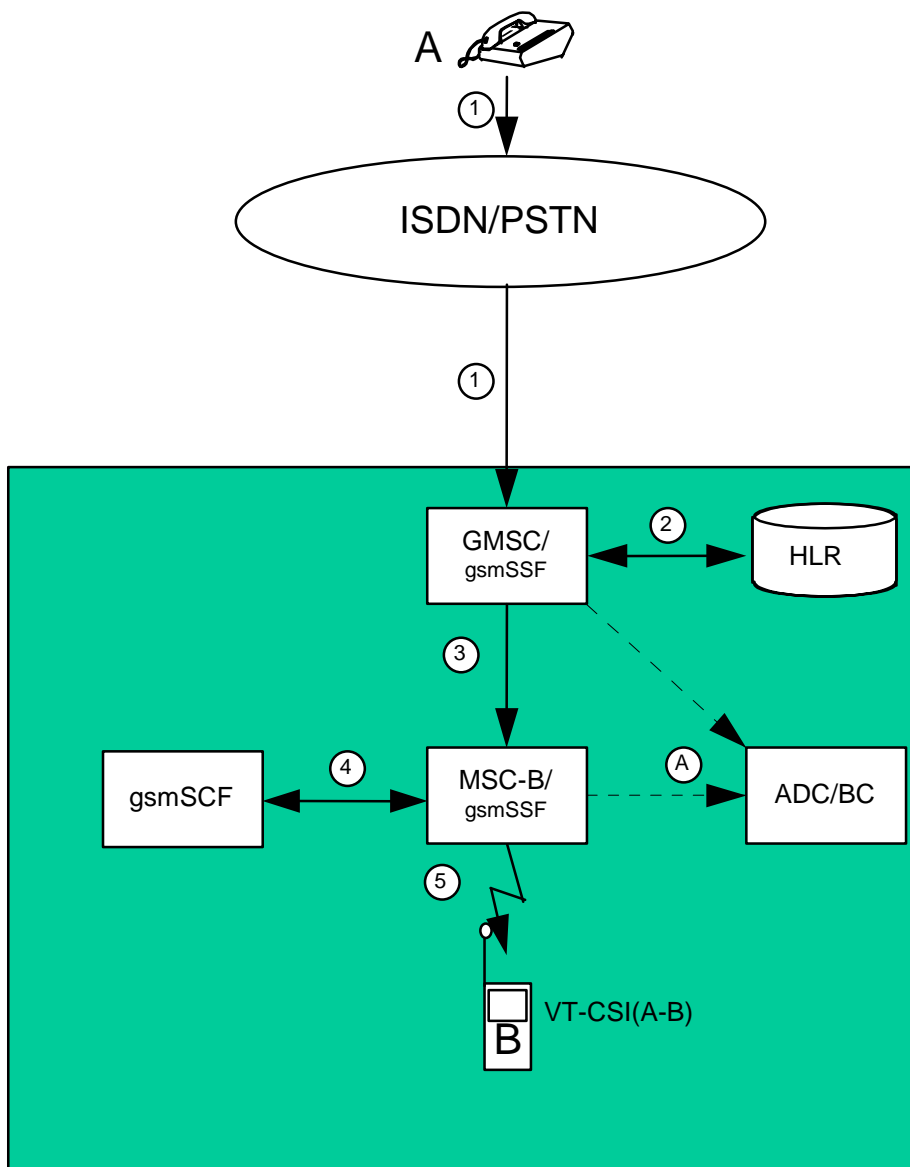

For avoidance of doubt, even if the MSC and GMSC are co-located both the MTC/TCR and gateway records shall be produced.

The generated records are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

The following records are generated in HPLMN in this call scenario:

**Table 11: Records Generated for Visiting Terminating Trigger Calls**

GMSC	MSC-B	HLR
Incoming gateway record	MTC record	HLR interrogation record
	Terminating CAMEL record	

**Figure 24: Incoming call handled by CAMEL in MSC Server without redirection**

### 5.2.2.20 Outgoing call handled by CAMEL Dialed CSI Trigger

Figure 25 illustrates an outgoing CAMEL call from a mobile CAMEL subscriber "A" to a fixed network subscriber "B" (1).

The "A" subscriber has an active D-CSI (stored in the VLR and modified Called Party number matches D-CSI). Therefore MSC server-A requests instructions from the gsmSSF which passes the CAMEL service key to the gsmSCF to indicate which service logic it should apply (2).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to MSC-A.

MSC server-A generates an MOC record for the "A" subscriber which contains D-CSI data. This record may be linked to an optional SCF-record.

The GMSC server routes the call to the "B" subscriber (3). The GMSC server shall create an outgoing gateway record as described in TS 32.205 [5].

The generated records are subsequently transferred to the post-processing system (A) either as event reports following the release of the connection or when collected by the post-processing system.

The following records are generated in HPLMN in this call scenario:

**Table 11: Records Generated for an Outgoing Call Handled by CAMEL**

GMSC server	MSC server	HLR
Outgoing gateway record	MOC record	-

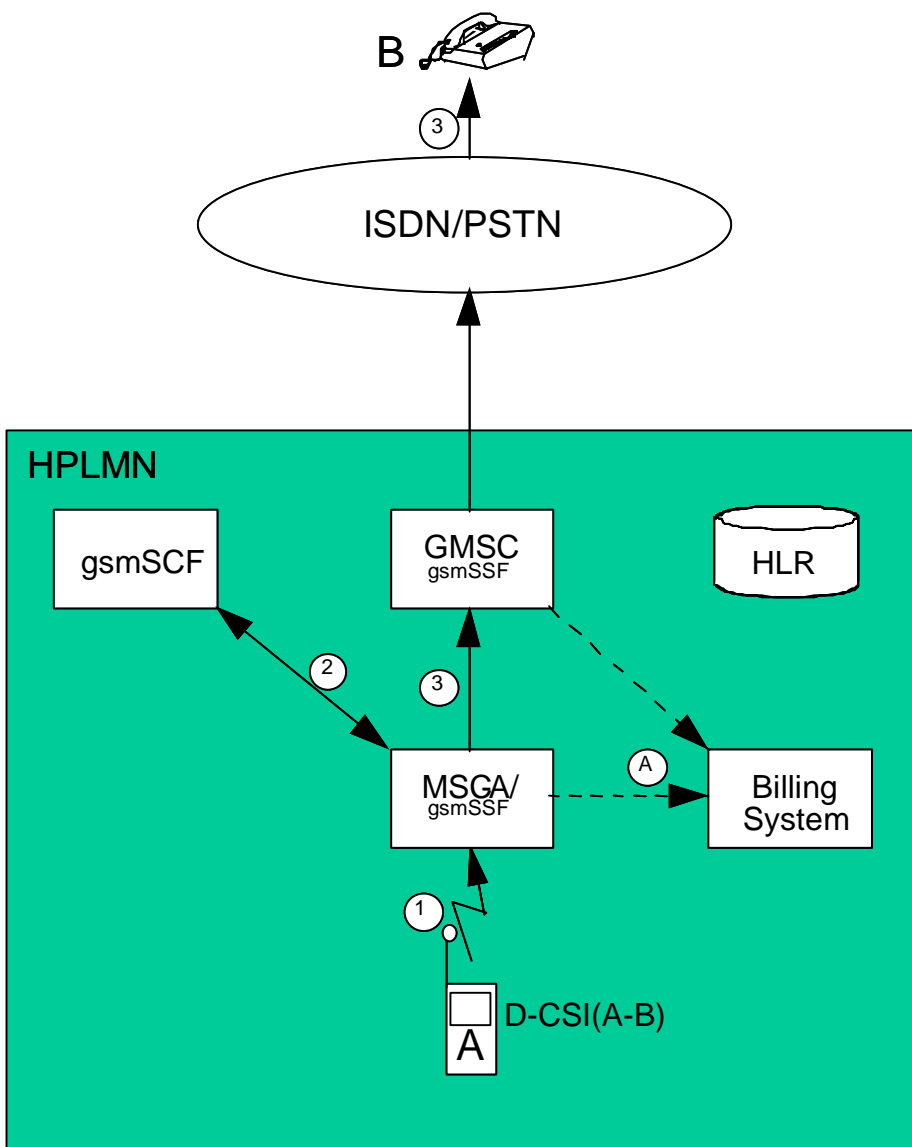

Figure 25: Outgoing call handled by CAMEL

5.2.2.21 Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL

Figure 26 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B". The call is subsequently forwarded to a second fixed network subscriber "C" by CAMEL initiated Call Forwarding.

The incoming call is routed to the GMSC server (1). The GMSC server shall create an incoming gateway record for fixed network accounting purposes.

The GMSC server interrogates the HLR of the called subscriber in order to fetch the T-CSI, O-CSI and D-CSI (2).

The "B" subscriber has an active T-CSI. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

The gsmSCF modifies the Called Party number and sets the CAP parameter 'Apply O-CSI'. When gsmSCF processing is complete the call control is returned to the GMSC server. The GMSC server shall generate a terminating CAMEL interrogation record which contains T-CSI data.

The "B" subscriber has an active O-CSI. Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (4).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

The gsmSCF modifies the Called Party number. When gsmSCF processing is complete the call control is returned to the GMSC server.

The "B" subscriber has an active D-CSI (modified Called Party number matches D-CSI). Therefore the GMSC server requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (5).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information. When gsmSCF processing is complete the call control is returned to the GMSC server.

The GMSC server redirects the call to the fixed network subscriber "C" (6). The GMSC server shall generate an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". The MOC record includes O-CSI data, the parameter 'CAMEL initiated CF indicator' and D-CSI data. The GMSC server shall also produce an outgoing gateway record as described in TS 32.205 [5].

The generated records are subsequently transferred to the post-processing system (A) either as event reports following the release of the connection or when collected by the post-processing system.

The following records are generated in HPLMN in this call scenario:

**Table 12: Records Generated in the Incoming Call with Redirection Decided and Forwarded Leg Handled by CAMEL**

GMSC server	MSC server	HLR
Incoming gateway record	-	HLR interrogation record
Terminating CAMEL record		
	MTC record	
MOC (CF) record		
Outgoing gateway record		

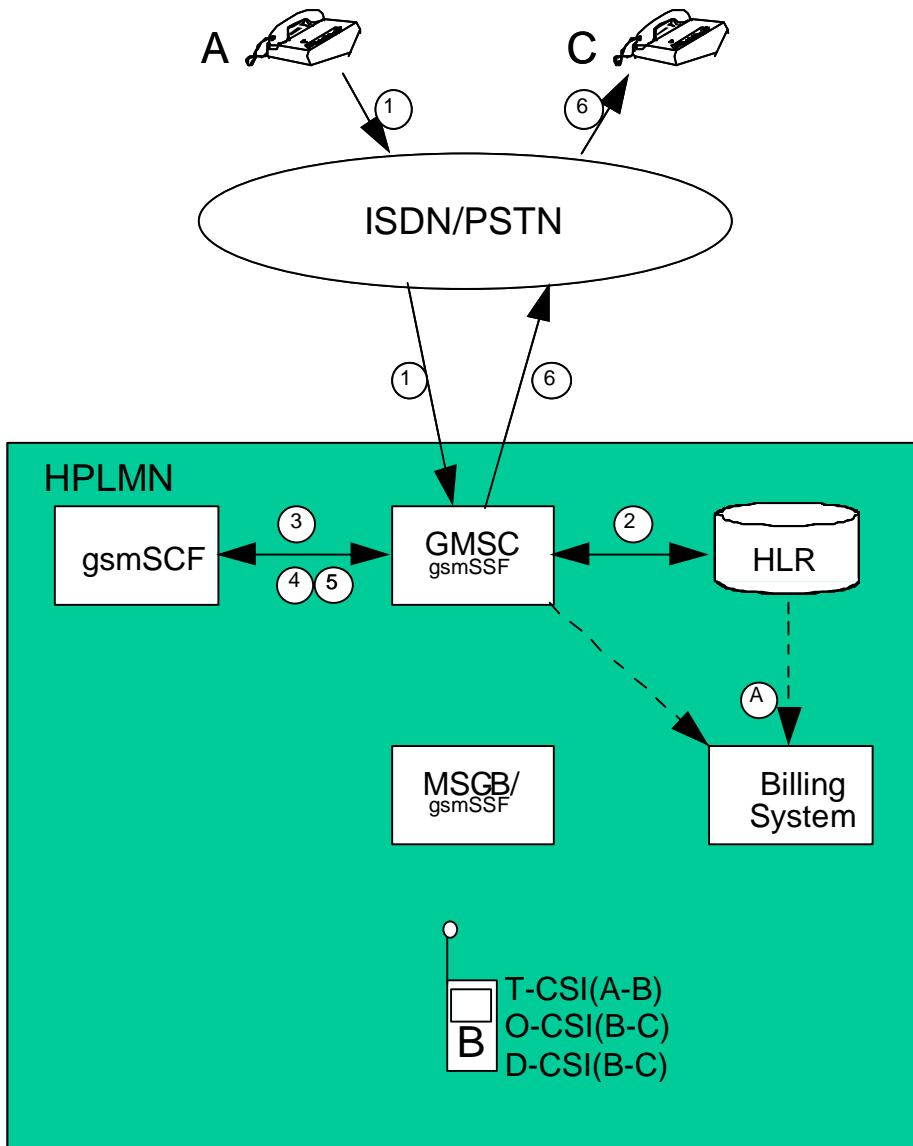

Figure 26: Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL

---

## 6 Packet-Switched Domain

### 6.1 Charging Principles

#### 6.1.1 Requirements

The following are high-level requirements specific to the packet domain, derived from the requirements in 3GPP TS 22.115 [2].

- 1) Every PDP context shall be assigned a unique identity number for billing purposes. (i.e. the charging id).
- 2) Data volumes on both the uplink and downlink direction shall be counted separately. The data volumes shall reflect the data as delivered to and from the user.
- 3) The charging mechanisms shall provide the duration of the PDP context with date and time information.
- 4) The UMTS operator may define a subset of the charging information specified by Packet-Switched domain charging standards. This means that it shall be possible to configure the SGSN and GGSN for the CDR information generated.
- 5) The GSNs shall be capable of handling the charging characteristics mechanism charging characteristics as specified in 3GPP TS 32.215 [6] provided through either HLR subscription data or default values. This is to improve charging record generation efficiency determined by the operator, based on the configuration of CDR trigger parameters at the GSNs. In particular the GSNs shall be able to:
  - SGSN: receiving (MAP) and forwarding (Gn) of the charging characteristics data item according to the rules specified in 3GPP TS 32.215 [6]
  - SGSN/GGSN: extracting the charging characteristics profile index (from the charging characteristics data item), determining the appropriate profile data (e.g. CDR trigger rules) and applying the profile data according to the rules specified in 3GPP TS 32.215 [6].
- 6) SGSN shall support charging of CAMEL services.

#### 6.1.2 Charging Information

Charging information in the Packet-Switched domain network is collected for each MS by the SGSNs and GGSNs, which are serving that MS. The information that the operator uses to generate an invoice to the subscriber is operator-specific. Billing aspects, e.g. a regular fee for a fixed period, are outside the scope of the present document.

The SGSN collects charging information for each MS related with the radio network usage, while the GGSN collects charging information for each MS related with the external data network usage. Both GSNs also collect charging information on usage of the Packet-Switched domain network resources.

The GSNs shall collect the following charging information:

1. usage of the radio interface: the charging information shall describe the amount of data transmitted in MO and MT directions categorised with QoS and user protocols;
2. usage duration: duration of PDP context is counted as the time interval from PDP Context activation to PDP Context Deactivation.
3. usage of the general Packet-Switched domain resources: the charging information shall describe the usage of other Packet-Switched domain-related resources and the MSs Packet-Switched domain network activity (e.g. mobility management).

4. destination and source: the charging information shall provide the actual source addresses used by the subscriber for the PDP context. The charging information shall describe the destination addresses with a level of accuracy as determined by the Access Point Name (APN).
5. usage of the external data networks: the charging information shall describe the amount of data sent and received to and from the external data network.

External networks can be identified by the Access Point Name (APN).

6. location of MS: HPLMN, VPLMN, plus optional higher-accuracy location information. The highest accuracy location information available in a GGSN is a SGSN address.

### 6.1.3 General Aspects of Charging Data

CDR generation and contents should be flexible and unnecessary redundancy in data should be avoided.

1. Each PDP context generates its own record types (the S-CDR for the SGSN and the G-CDR for the GGSN related to PDP contexts).
2. The SGSN can optionally provide a record for mobility management of the attached MS in the M-CDR.
3. The SGSN shall provide two SMS related records, in case of Packet-Switched domain delivered MO short message S-SMO-CDR and MT short message S-SMT-CDR.
4. MS Location information shall be included in the SGSN PDP context records.
5. Records shall only include relevant information, i.e. traffic activity since last record.
6. Change of tariff period (if used) should not cause new CDRs to be sent to avoid peaks in data transfer. Instead such events should close the existing volume counters and open new ones when appropriate traffic is detected. This can be done by having a new record in the same message. It is up to the operator how often the CDRs are transferred from a GSN.
7. Both SGSN and GGSN nodes shall collect information from same chargeable sessions (PDP contexts). A unique reference (Charging ID in combination with GGSN address) is needed to enable correlation between information from several records produced from same PDP context.
8. The RNC shall collect the amount of not transferred downlink data, i.e., data that the RNC has either discarded or forwarded to a 2G-SGSN, for an MS's RABs when instructed by the 3G-SGSN.

### 6.1.4 Volume counting in RNC

The 3G-SGSN counts all downlink data sent to the RNC over Iu interface. Any discarded data between MS and RNC causes inaccurate charging, as the 3G-SGSN cannot account for this and subsequently causing overcharging. Additionally any buffered data in the RNC at RAB release or forwarded to another SGSN during handover is possible counted again i.e. twice, which causes overcharging.

To avoid inaccurate charging at the 3G-SGSN, the 3G-SGSN will always instruct the RNC at RAB set-up to count the unsent downlink data towards the MS.

The reporting of unsent data by the RNC to the 3G-SGSN will only occur at RAB release. This occurs at either the termination of the PDP context or handover.

The 3G-SGSN shall not use the optional 'Data Volume Request' message to RNC in any situation, as this shall cause a significant performance impact to both the RNC and 3G-SGSN.

When 3G-SGSN receives a report of unsent data volume from the RNC at RAB release. The 3G-SGSN shall report this value to the 'RNC Unsent Downlink Volume' field in the S-CDR.

### 6.1.5 Generation of Charging ID

The concept of serving connections is different in the Circuit-Switched domain to that for the Packet-Switched domain. Therefore different mechanisms are needed to supply the Billing Systems with charging information.

In the Packet-Switched domain the complete PDP context handling can be switched over from an old SGSN to a new SGSN due to routing area updates with the consequence that charging records will be generated in more than one SGSN. Furthermore different data has to be collected in the SGSNs and GGSNs. So for one PDP context, charging records are needed from both the SGSN and GGSN.

The Billing System (BS) shall be provided with all relevant information from the network to charge for that one activated PDP context.

During the active PDP context all records, which belong to this context could normally be identified by the TID. However:

- an MS can activate and deactivate PDP contexts in a very short time interval, and these PDP contexts can have the same TID (only parallel established PDP contexts have different TIDs);
- different SGSNs can be involved in the same PDP context as described above;
- the timing clocks of the GSN elements may not be fully synchronised.

The records of one PDP context may be correlated by the Billing System using a unique Charging ID number (C-ID) assigned to all records generated for that one PDP context.

The unique C-ID is generated in the GGSN when the PDP context is activated. A C-ID is generated for each activated context, so that each has a unique C-ID. The C-ID shall be transferred from the GGSN to the new SGSN in the routing area update response message. All CDRs for each activated PDP context generated by each SGSNs and GGSNs shall therefore contain the same unique combination of the C-ID and GGSN address, to permit subsequent Charging Gateway / Billing System (BS) correlation of the generated CDRs.

This combination of GGSN address together with the C-ID should be a unique identification over a long period of time in all Packet-Switched domain networks.

### 6.1.6 Charging for SMS

SMS transmission (MO or MT) can be provided in the Packet-Switched domain via the SGSN. The SGSN shall provide an S-SMO-CDR when short message is mobile originated and an S-SMT-CDR when it is mobile terminated. In addition, also SMS-IWMSC (MO-SMS) and SMS-GMSC (MT-SMS) may provide SMS related CDRs as described in Section 5.2.

No active PDP context is required when sending or receiving short messages. If the subscriber has an active PDP context, volume counters of S-CDR are not updated due to short message delivery.

The contents of S-SMO and S-SMT CDRs are presented in TS 32.205 [5].

### 6.1.7 Charging support for CAMEL

CAMEL Packet-Switched domain interworking can be activated for the Packet-Switched session, SGSN PDP context and mobile originated SMS based on subscription information stored in HLR. Control point for all CAMEL interactions in Packet-Switched domain reside at gprsSSF typically co-located with SGSN. GGSN is not aware of CAMEL service at all. For more information about CAMEL interworking (see 3GPP TS 23.078 [13]).

An M-CDR, S-CDR and S-SMO-CDR include basic information about CAMEL service information, such as service key and SCF address, and service usage, such as CAMEL modification information and amount of signalling. CAMEL service may also send transparent free format data in one or several messages to be stored in the CDR. Each received free format data indicates whether it is overwritten or appended to previously received free format data.

CAMEL service may deny the GPRS attach, PDP context activation or sending of short message. CAMEL service may also change the APN determined by SGSN before activating PDP context or it may change the destination information of short message.

CAMEL feature to download advice of charge parameters does not need to be supported because sending of these parameters down to MS and usage in the MS is not standardised for Packet-Switched domain terminals. The message itself shall however be supported and in case of a relative tariff switch is received, then at that tariff switch time volume counts shall be reported to CAMEL service.

## 6.2 Charging Data Collection

In order to provide the data required for the management activities outlined in the previous chapters (billing, accounting, statistics etc.), the SGSN and GGSN shall be able to produce a CDRs for each of the following:

- Charging Data in the SGSN (S-CDR)
- Charging Data in the GGSN (G-CDR)
- Mobile Station Mobility Management Data in SGSN (M-CDR)
- SMS Mobile Originated Data in SGSN (S-SMO-CDR)
- SMS Mobile Terminated Data in SGSN (S-SMT-CDR)

The contents and purpose of each of these records are described in the following subclauses. A detailed formal description of the data defined in the present document is to be found in TS 32.215 [6].

### 6.2.1 Charging Data Record Generation

The S-CDR, M-CDR G-CDR, S-SMO-CDR and S-SMT-CDR are generated by the SGSN and GGSN to collect charging information such that they may be subsequently transferred to the Charging Gateway Function (CGF).

The generation of CDRs, partial CDRs and coherent trigger conditions (e.g. "maximum number of charging conditions changes") depend on the charging characteristics profile data which is determined via the charging characteristics profile index. The mechanism of conveying the charging characteristics data item (HLR -> SGSN -> GGSN) and determining the appropriate profile data by the GSNs is specified in 3GPP TS 32.215 [6]. In the GSNs it shall be possible to activate and deactivate CDR generation for each Charging Characteristics profile. If CDR generation is activated, it shall be possible to define separate trigger conditions values per Charging Characteristics profile for the following triggers:

- data volume limit;
- time (duration limit);
- maximum number of charging conditions changes (QoS change, Tariff Time change).

The following subclauses describe the trigger conditions for collection of charging information and CDR generation by the SGSN/GGSN.

#### 6.2.1.1 Triggers for S-CDR Charging Information Collection

An S-CDR is used to collect charging information related to the PDP context data information for a mobile in the SGSN.

If according to the Charging Characteristics profile data, CDR generation is activated an S-CDR shall be opened at PDP context activation. The record includes details such as Record Type, Served IMSI, Sequence Number etc. Not all of the charging information to be collected is static, and other charging information is directly depending on dynamic Packet-Switched service usage.

The subsequent subclauses identify the conditions for adding information to, and closing the S-CDR for generation towards the CGF.

### 6.2.1.1.1 Triggers for S-CDR Charging Information Addition

The "List of Traffic Volumes" attribute of the S-CDR consists of a set of containers, which are added when specific trigger conditions are met, and identify the volume count separated for uplink and downlink traffic on encountering that trigger condition. Table 11 identifies which conditions are supported to trigger S-CDR charging information addition.

**Table 11: Triggers for S-CDR charging information addition**

Trigger Conditions	Description/Behaviour
QoS Change	A change in the QoS shall result in a "List of Traffic Data Volumes" container being added to the CDR.
Tariff Time Change	On reaching the Tariff Time Change a "List of Traffic Data Volumes " container shall be added to the CDR.
CDR Closure	A list of "List of Traffic Data Volumes" container shall be added to the S-CDR.

### 6.2.1.1.2 Triggers for S-CDR Closure

The S-CDR shall be closed on encountering some trigger conditions. Table 12 identifies which conditions are supported to permit closure of the S-CDR.

**Table 12: Triggers for S-CDR closure**

Closure Conditions	Description/Behaviour
End of PDP Context within the SGSN	Deactivation of the PDP context in the SGSN shall result in the CDR being closed. The trigger condition covers:- <ul style="list-style-type: none"> <li>- termination of PDP context,</li> <li>- SGSN change (inter-SGSN routing area update including system handover),</li> <li>- any abnormal release.</li> </ul>
Partial Record Reason	O&M reasons permit the closure of the CDR for internal reasons. The trigger condition covers:- <ul style="list-style-type: none"> <li>- data volume limit,</li> <li>- time (duration) limit,</li> <li>- maximum number of charging condition changes,</li> <li>- management intervention.</li> </ul>

The Partial Record generation trigger thresholds are those associated with the Charging Characteristics profile data. The Charging Characteristics profile data is determined as defined in 3GPP TS32.215 [6].

The Partial Record generation trigger thresholds are GSN configuration parameters defined per charging characteristics profile by the operator through O&M means (refer to 3GPP TS32.215 [6]).

In the event that the S-CDR is closed and the PDP context remains active, a further S-CDR shall be opened with an incremented Sequence Number in the SGSN.

### 6.2.1.2 Triggers for M-CDR Charging Information Collection

An M-CDR is used to collect charging information related to the mobility management of a mobile in the SGSN.

An M-CDR shall be opened for each mobile upon GPRS Attach, and record details such as Record Type, Served IMSI, Sequence Number etc. Not all of the charging information to be collected is static, and other charging information is directly dependent on the mobility of the MS as provided by the Radio Access Network (RAN). Subsequent partial records may be opened if the M-CDR is closed and the MS is still attached to the network.

The subsequent subclauses identify the conditions for adding information to, and closing of the M-CDR for generation towards the CGF.

### 6.2.1.2.1 Triggers for M-CDR Charging Information Addition

The "Change of Location" attribute of the M-CDR consists of a set of containers, which are added when specific trigger conditions are met, and identify the time stamped routing area on encountering that trigger condition. Table 13 identifies which conditions are supported to trigger M-CDR charging information addition.

**Table 13: Triggers for M-CDR Charging Information Addition**

Trigger Conditions	Description/Behaviour
Mobility Change	A change in the Routing Area shall result in a "Change of Location" container being added to the M-CDR.

### 6.2.1.2.2 Triggers for M-CDR Closure

The M-CDR shall be closed on encountering some trigger conditions. Table 14 identifies which conditions are supported to permit closures of the M-CDR.

**Table 14: Triggers for M-CDR closure**

Closure Conditions	Description/Behaviour
End of MM Context within SGSN	Deactivation of the MM context in the SGSN shall result in the CDR being closed. The trigger condition covers:- <ul style="list-style-type: none"> <li>- SGSN change (inter-SGSN routing area update including system handover),</li> <li>- GPRS detach,</li> <li>- any abnormal release.</li> </ul>
Partial Record Reason	O&M reasons permit the closure of the CDR for internal reasons. The trigger condition covers:- <ul style="list-style-type: none"> <li>- time (duration) limit,</li> <li>- maximum number of mobility changes, and</li> <li>- Management intervention,</li> <li>- Intra system handover (change of radio interface from GSM to 3G or visa versa).</li> </ul>

In the event that the M-CDR is closed and the mobile is still known to the SGSN, a further logical M-CDR shall be opened with an incremented Sequence Number in the SGSN.

### 6.2.1.3 Triggers for G-CDR Charging Information Collection

A G-CDR is used to collect charging information related to the packet data information for a mobile in the GGSN.

If, according to the Charging Characteristics profile data, CDR generation is activated a G-CDR shall be opened at PDP context activation. The record includes details such as Record Type, Served IMSI, Sequence Number etc. Not all of the charging information to be collected is static, and other charging information is directly dependent on dynamic Packet-Switched service usage.

The "List of Traffic Data Volumes" attribute of the G-CDR consists of a set of containers, which are added following specific trigger conditions, and identify the volume count on encountering that trigger condition. The trigger conditions are as for the S-CDR (see subclause 6.2.2.1 on "Triggers for S-CDR Charging Information Collection") with exception that an SGSN change will not close the G-CDR. Subsequent partial records may be opened if the G-CDR is closed and the PDP context is still active.

The Partial Record generation trigger thresholds are those associated with to the determined Charging Characteristics profile data. The Charging Characteristics profile data is determined as defined in 3GPP TS32.215 [6].

The Partial Record generation trigger thresholds are GSN configuration parameters defined per charging characteristics profile by the operator through O&M means (refer to 3GPP TS32.215 [6]).

In the event that the G-CDR is closed and the PDP context remains active, a further G-CDR is opened with an incremented Sequence Number in the GGSN.

## 6.2.2 Charging scenarios

This subclause contains a number of example scenarios illustrating the purpose and practical usage of the various types of records defined in the previous subclauses. These examples are by no means exhaustive.

For the purpose of these examples the following assumptions have been made:

- the CDRs are sent to a CGF;
- the generation of all of the CDR types has been enabled.

The following conventions have been used for the Figures 27, 28, 29 and 30, contained within this subclause:

- 1) Network connections and signalling transactions are illustrated by means of solid lines and referenced by number e.g. (1).
- 2) Operation & Maintenance actions, such as the transfer of CDRs, are represented by means of dotted lines and referenced by letter e.g. (A).

Note: visiting scenarios are excluded.

### 6.2.2.1 Mobile to PDN Context

Figure 27 illustrates a simple outgoing Packet-Switched context from a PLMN Packet-Switched service subscriber "A" to a mainframe "B" via a PDN (1).

The respective PDP context is activated in the SGSN and GGSN and PDP PDUs are routed in MO and MT direction. The SGSN shall create an S-CDR and the GGSN shall create a G-CDR for subscriber "A".

The records generated are subsequently transferred to the CGF (A). The CGF transfers the CDRs to the BS.

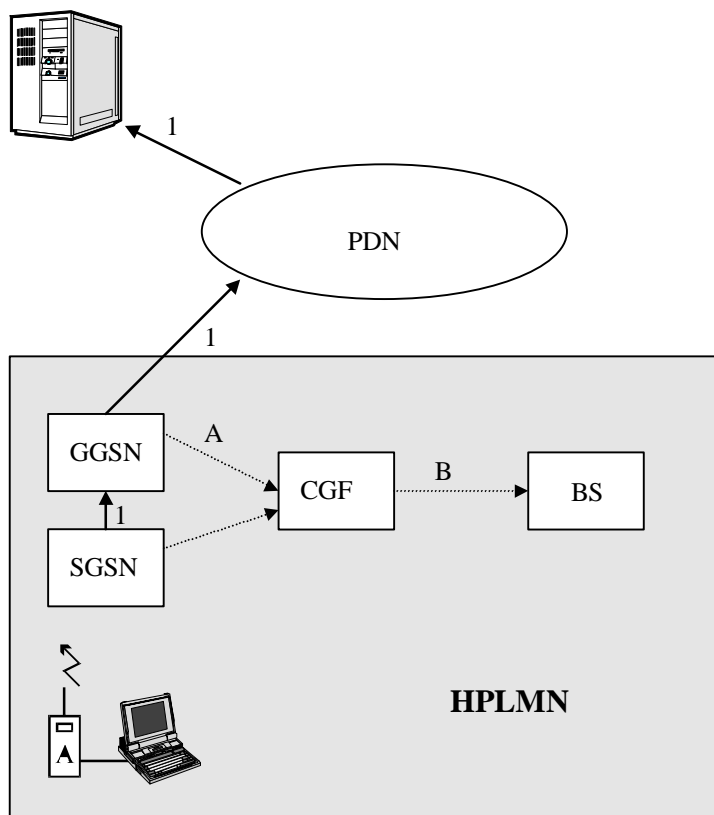

Figure 27: Mobile to PDN Context

### 6.2.2.2 Mobile to Mobile Context

Figure 28 illustrates a simple Packet-Switched mobile to mobile context within the same HPLMN.

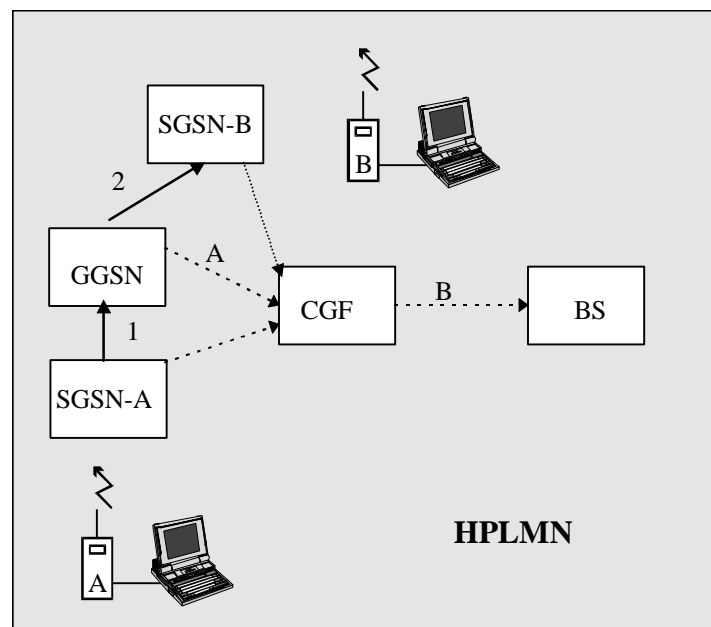

The respective A-party related PDP context is activated in the SGSN-A and the GGSN (1).

After the location of subscriber "B" is determined, the B party related PDP context is activated (2) in the SGSN-B and the GGSN and PDP PDUs are routed in MO and MT direction. The SGSN-A shall create an S-CDR and the GGSN shall create a G-CDR for subscriber A, the SGSN-B shall create an S-CDR and the GGSN shall create a G-CDR for subscriber "B".

If subscriber "A" and subscriber "B" use the same GGSN, both G-CDRs are produced at that GGSN.

If session leg (2) requires a PDP context activation the respective PDP records will contain a network initiated PDP context activation-flag.

The records generated are subsequently transferred to the CGF (A). The CGF transfers the CDRs to the BS.

**Figure 28: Packet-Switched Mobile to Mobile Context**

### 6.2.2.3 PDN to Mobile Context

Figure 29 illustrates a simple incoming Packet-Switched domain context from a mainframe "A" to mobile subscriber "B" via a PDN (1). After the location of subscriber "B" is determined, the PDP context is activated (2).

The GGSN receiving the PDUs shall generate a G-CDR whereas the SGSN currently serving subscriber "B" creates an S-CDR. These records contain a flag that the PDP context is activated due to network request.

The records generated are subsequently transferred to the CGF (A). The CGF transfers the CDRs to the BS.

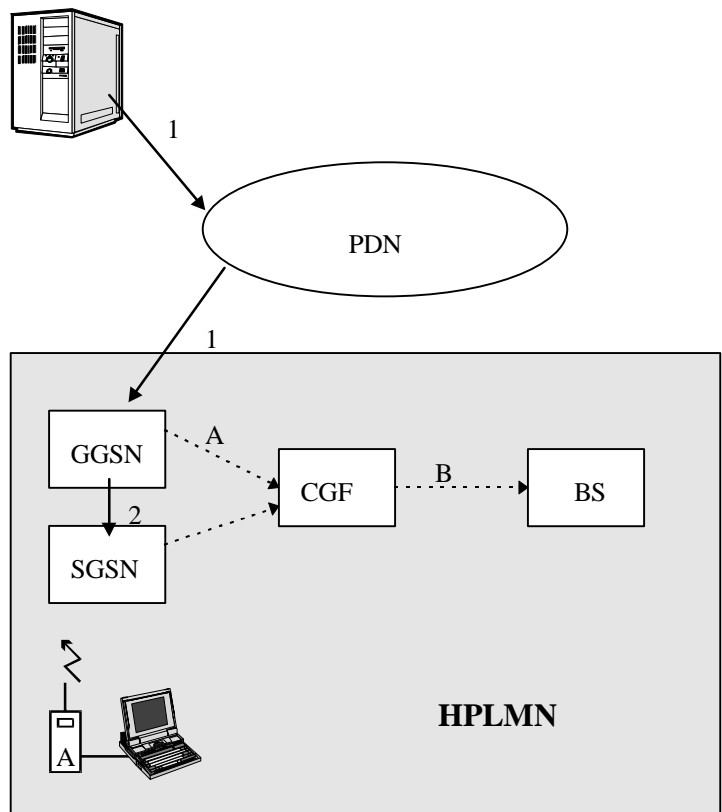

Figure 29: PDN to Mobile Context

6.2.2.4 Mobile to PDN Context while roaming, GGSN in HPLMN

Figure 30 illustrates an outgoing Packet-Switched context from a roaming mobile subscriber "A" to mainframe "B" via Boarder Gateway, inter PLMN backbone and GGSN of the HPLMN (1).

The respective a-party related PDP context is activated in the SGSN and GGSN and PDUs are routed in MO and MT direction. The SGSN shall create an S-CDR (VPLMN) and a G-CDR is generated at the used GGSN (HPLMN) for subscriber "A". From the GGSN the packets are sent via the PDN to the mainframe "B".

The records generated in the HPLMN and the VPLMN are subsequently transferred to the CGFs (A). The CGFs transfer the CDRs to the BS. (B)

Later on the records created in the VPLMN are transferred from the BS to the BS of the HPLMN via TAP procedure (C).

Note that this scenario is an example, representing only one case of roaming CDR generation.

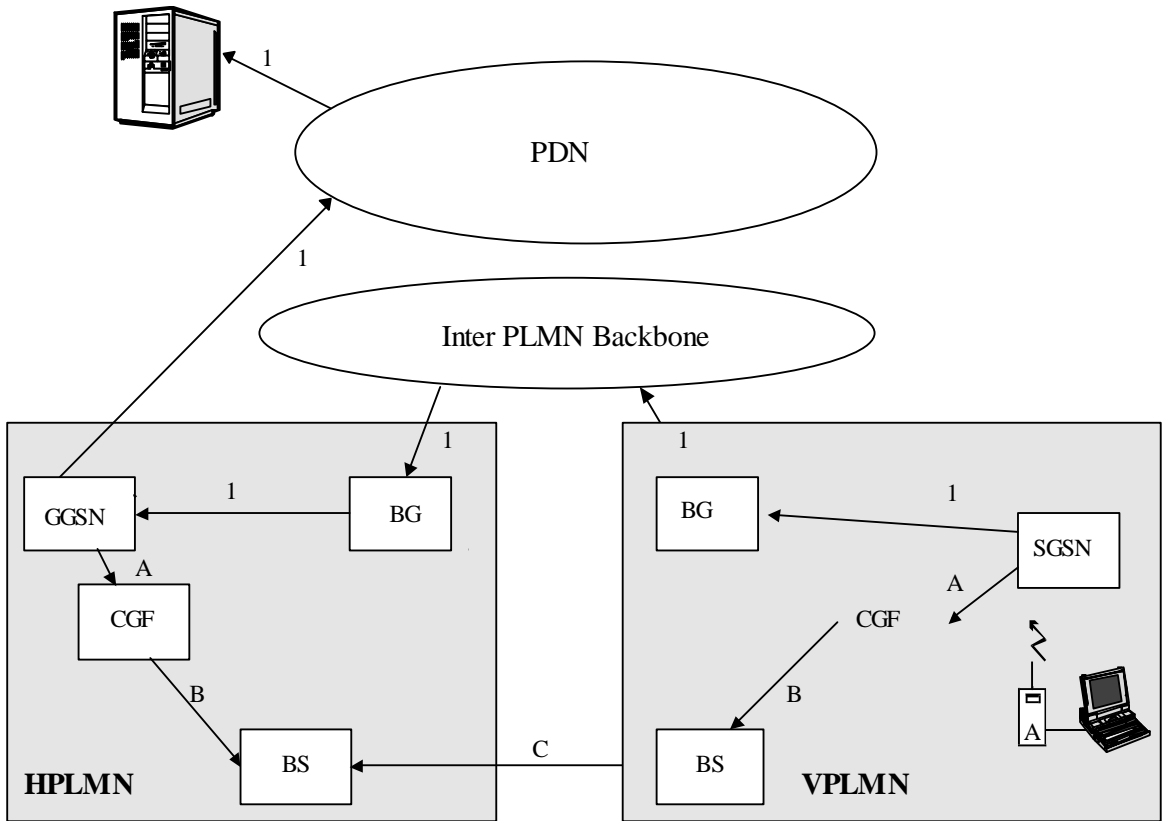

Figure 30: Mobile to PDN Context whilst roaming via BG

---

## 7 Application Services

Applications/services such as MMS and LCS are provided to the 3G subscribers via service nodes (which are outside the scope of the 3G core network). These servers (service nodes) responsible for the provision of an application services to a subscriber, can generate a service related CDR to record the details of the service transaction provided. The specific CDRs are defined in the specification TS 32.235 "Charging data description for application services" [17].

### 7.1 Multimedia Messaging Service

The Multimedia Messaging Service (MMS) charging description is based on the interface description in TS 23.140 "Multimedia Messaging Service, Functional description, Stage 2 [19]. These MMS-CDRs are delivered by the MMS Relay/Server when receiving or delivering multimedia messages to the MMS User Agent or to another Multimedia Messaging Service Environment (MMSE).

#### 7.1.1 Charging Principles

##### 7.1.1.1 Charging Information

Charging information for the usage of Multimedia Messaging Service is collected for each MS by the Multimedia Messaging Relay/Server (MMS R/S), which is serving that MMS User Agent. The information that the operator uses to generate an invoice to the subscriber is operator-specific. Billing aspects, e.g. a regular fee for a fixed period, are outside the scope of the present document.

The MMS R/S collects charging information for each MS related with value-added service and the usage of MMS specific network resources.

The MMS R/S shall collect the following charging information:

- usage of the radio interface: the charging information shall describe the amount of data transmitted in MO and MT directions for the transfer of MM;
- usage duration: the storage duration of MM is counted as either (1) the time interval from the beginning of storage of the message until forwarding to another MMS R/S or as (2) the time interval from the beginning of storage until reception of the MM by an MMS User Agent. This is the time interval when a MM is saved on a non-volatile memory media;
- usage of the general Packet-Switched domain resources: the charging information shall describe the usage of other Packet-Switched domain-related resources;
- destination and source: the charging information shall provide the actual destination and source addresses used by the subscriber;
- usage of the external data networks: the charging information shall describe the amount of data sent and received to and from the external data network;
- the MMS R/S address: this provides the highest accuracy location information available.

#### 7.1.2 Charging scenarios

This subclause contains an example scenario illustrating the purpose and practical usage of the various types of records defined in the interface description [19].

The MM submission in the MMS Relay/Server is routed in MMSO and MMSR direction. The Originator MMS Relay/Server and the Recipient MMS Relay/Server shall create the MMSO-CDR and the MMSR-CDR for the originator and recipient User Agent (UA).

For the purpose of this example the following assumptions have been made:

- originator MMS UA party is "A" and recipient MMS UA is party "B";
- ...

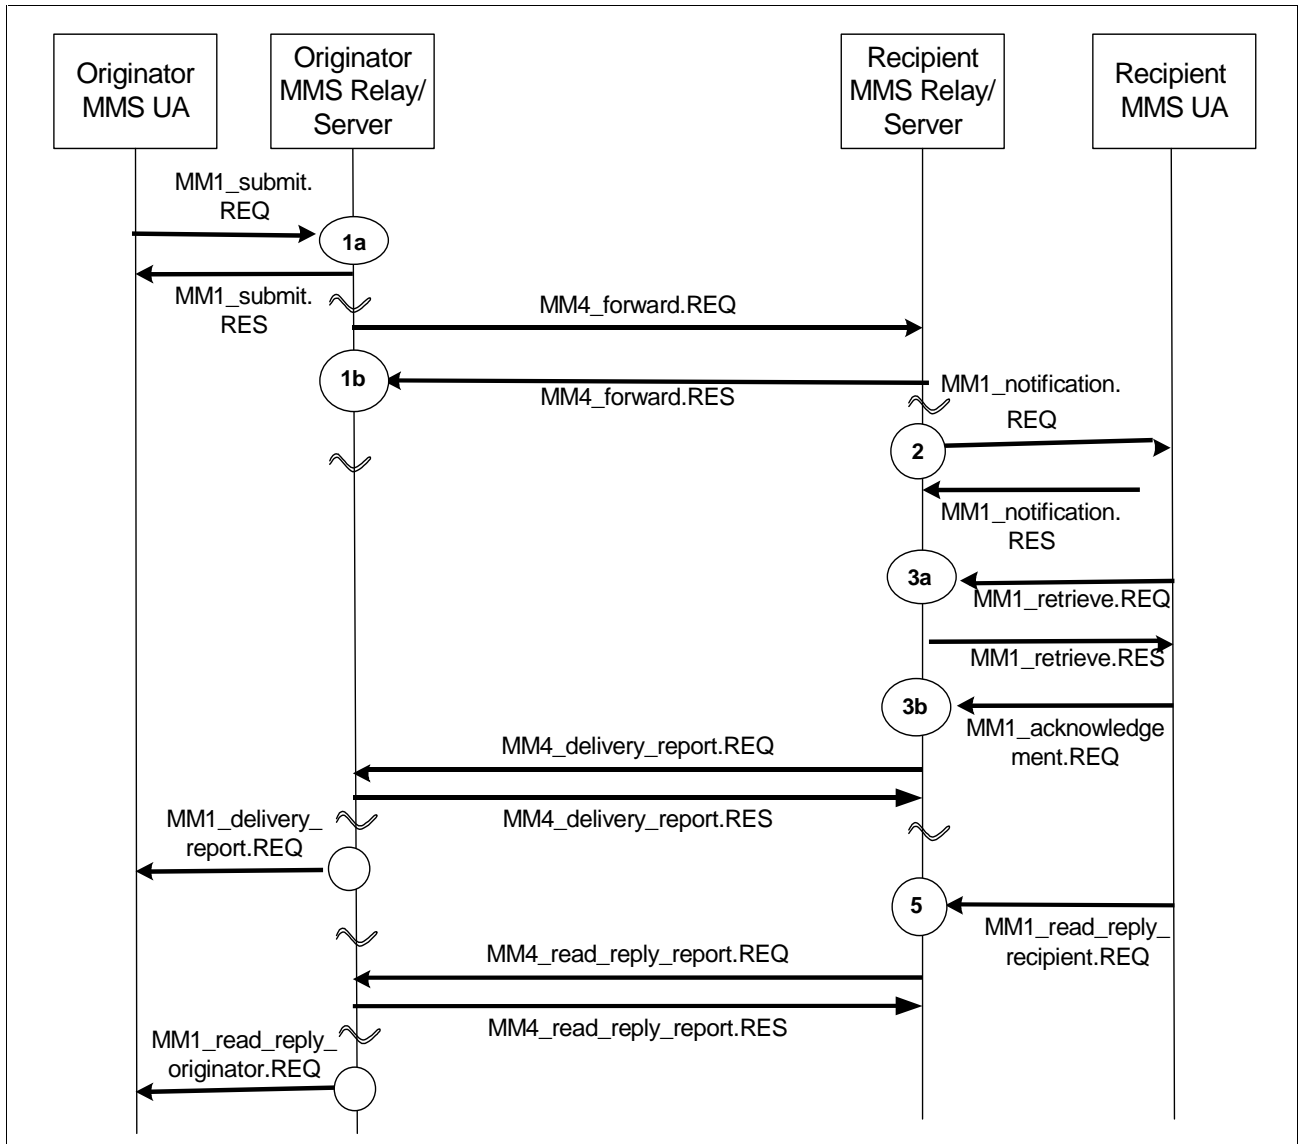

Figure 31: Example Abstract Message Flow

The records are generated in the MMS Relay/Server in this call scenario are shown in the following tables:

**Table 15: Submission of MM from Originator MMS UA to Originator MMS Relay/Server (Trigger Point 1a and 1b)**

Record Parameter	Content
Record Type	MMSO-CDR
Message Type	Message-MM
Originator Address	E-mail-address /MSISDN of A/IP address
Recipient Address	List of E-mail-address/MSISDN of B1 ... Bn
Submission Time	Timestamp of MM1_submission_REQ arrived at O-R/S
Duration of Transmission	Time between receipt of MM1_submission_REQ and MM1_submission_RES
Duration of Storage	Time between MM1_submission_RES and MM4_forwarding_RES
Sequence Number	1a and 1b

**Table 16: MM Notification from Recipient MMS Relay/Server to Recipient MMS UA (Trigger Point 2)**

Record Parameter	Content
Record Type	MMSR-CDR
Message Type	Notification
Originator Address	E-mail-address /MSISDN of A/IP address
Recipient Address	E-mail-address/MSISDN of B
Delivery Time	Timestamp at MM1_notification_REQ at R-R/S
Duration of Transmission	Not Applicable
Duration of Storage	Not Available
Sequence Number	Not Applicable

**Table 17: Acknowledgement of MM retrieval from Recipient MMS UA to Recipient MMS Relay/Server (Trigger Points 3a and 3b)**

Record Parameter	Content
Record Type	MMSR-CDR
Message Type	Message-MM
Originator Address	E-mail-address /MSISDN of A/IP address
Recipient Address	E-mail-address/MSISDN of B
Delivery Time	Timestamp of MM1_retrieve_REQ arrived at O-R/S
Duration of Transmission	Time between receipt of MM1_submission_REQ and MM1_acknowledge_RES, only applicable if acknowledgement was requested
Duration of Storage	Time between MM4_forwarding_RES and MM1_retrieve_RES
Sequence Number	3a and 3b

**Table 18: Delivery Report to Originator MMS UA (Trigger Point 4)**

Record Parameter	Content
Record Type	MMSR-CDR
Message Type	Delivery-Report
Originator Address	E-mail-address /MSISDN of B/IP address
Recipient Address	E-mail-address/MSISDN of A
Delivery Time	Timestamp of MM1_delivery_report_REQ at O-R/S
Duration of Transmission	Not Available
Duration of Storage	Not Available
Sequence Number	Not Applicable

**Table 19: Read Reply Information from Recipient MMS UA to Recipient MMS Relay/Server (Trigger Point 5)**

<b>Record Parameter</b>	<b>Content</b>
Record Type	MMSO-CDR
Message Type	Read-reply
Originator Address	E-mail-address /MSISDN of B/IP address
Recipient Address	E-mail-address/MSISDN of A
Submission Time	Timestamp of MM1_read_reply_recipient_REQ arrived at R-R/S
Duration of Transmission	Not Available
Duration of Storage	Not Available
Sequence Number	Not Applicable

**Table 20: Read Replay Report to Originator MMS UA (Trigger Point 6)**

<b>Record Parameter</b>	<b>Content</b>
Record Type	MMSR-CDR
Message Type	Read-reply
Originator Address	E-mail-address /MSISDN of B/IP address
Recipient Address	E-mail-address/MSISDN of A
Delivery Time	Timestamp of MM1_read_reply_originator_REQ at O-R/S
Duration of Transmission	Not Available
Duration of Storage	Not Available
Sequence Number	Not Applicable

# Foreword

This Technical Specification (TS) has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

# 1 Scope

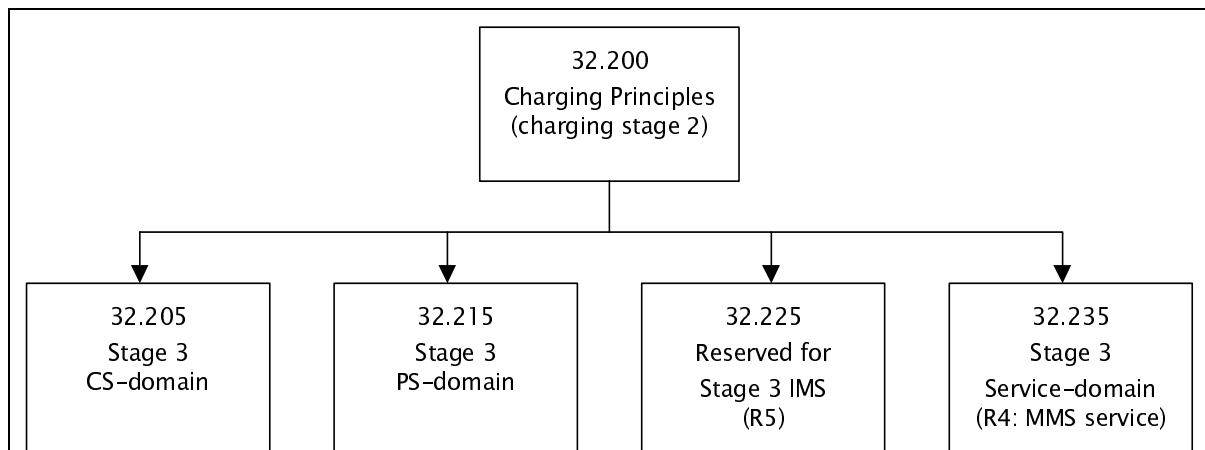

The GSM and UMTS PLMNs support a wide range of circuit based services. In order to enable operators the ability to provide a commercially viable service there is a need to provide charging functions.

This document is part of a series of documents specifying charging functionality in UMTS networks. The UMTS charging architecture and principles are specified in TS 32.200 [22] which provides an umbrella for other charging documents that specify the structure and content of the CDRs and the interface protocol that is used to transfer them to the collecting node.

The present document specifies the structure and the contents of the CDRs that are collected by the relevant network elements for circuit switched services in 2G (GSM) and 3G (UMTS) networks. It also defines the syntax for the transfer of these CDRs from the collecting nodes to billing post-processing systems using standard file transfer protocols.

The CDRs content and transport within the PS domain are described in TS 32.215 [23] document, while CDRs used for application services are defined in document TS 32.235 [24].

The relationship among these charging specifications is illustrated below.

**Figure 1: Charging Documents Structure**

The interface definitions of GSM 12.05 are maintained for 2G, in order to assure backward compatibility to earlier GSM releases.

The charging architecture and principles that the present document is based on are specified in TS 32.200 [22].

All references, abbreviations, definitions, descriptions, principles and requirements that are common to charging in UMTS domains or subsystems are provided in the umbrella document [22]. To avoid unnecessary duplications, they are not repeated in the present document unless it is essential.

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.

- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 3 Definitions, abbreviations and symbols

### 3.1 Definitions

**(GSM only):** indicates that this section or paragraph applies only to a GSM system. For multi-system cases this is determined by the current serving radio access network.

**(UMTS only):** indicates that this section or paragraph applies only to a UMTS system. For multi-system cases this is determined by the current serving radio access network.

**advice of charge:** The real-time display of the network utilisation charges incurred by the Mobile Station. The charges are displayed in the form of charging units. If a unit price is stored by the MS then the display may also include the equivalent charge in the home currency.

**aoc service:** A combination of one or more services, both basic and supplementary, together with a number of other charging relevant parameters to define a customised service for the purpose of advice of charge.

**CAMEL:** A network feature that provides the mechanisms to support operator specific services even when roaming outside HPLMN.

**CAMEL subscription information:** Identifies a subscriber as having CAMEL services.

**CDR (Charging Data Record):** A record generated by a network element for the purpose of billing a subscriber for the provided service. It includes fields identifying the user, the session and the network elements as well as information on the network resources and services used to support a subscriber session. In the traditional circuit domain, CDR has been used to denote "Call Detail Record", which is subsumed by "Charging Data Record" hereafter.

**charging destination:** Also referred to as a destination for charging, this is a nominal reference defining the point of termination of a connection for charging purposes.

**charging origin:** A nominal reference defining the point of origin of a connection for charging purposes.

**observed IMEI ticket:** A record used to describe an EIR relevant event e.g. a blacklisted IMEI

**successful call:** A connection that reaches the communication or data transfer phase e.g. the "answered" state for speech connections. All other connection attempts are regarded as unsuccessful.

### 3.2 Abbreviations

For the purposes of the present document the following abbreviations apply. Additional applicable abbreviations can be found in TS 21.905 [1].

AoC	Advice of Charge
BCSM	Basic Call State Model
CAI	Charge Advice Information
CAMEL	Customised Applications for Mobile network Enhanced Logic
CDR	Call Detail Record
DP	Detection Point
EDP	Event Detection Point
EIR	Equipment Identity Register
ETSI	European Telecommunications Standard Institute
FCI	Furnish Charging Information
FTAM	File Transfer, Access and Management
GMSC	Gateway MSC
gsmSCF	GSM Service Control Function
gsmSSF	GSM Service Switching Function
HLR	Home Location Register
HPLMN	Home PLMN
HSCSD	High Speed Circuit Switched Data
IMEI	International Mobile Equipment Identity
IMSI	International Mobile Subscriber Identity
ISDN	Integrated Services Digital Network

LAC	Location Area Code
MOC	Mobile Originated Call (attempt)
MS	Mobile Station
MSC	Mobile Switching Centre
MSRN	Mobile Station Roaming Number
MTC	Mobile Terminated Call (attempt)
NE	Network Element
O_CSI	Originating CAMEL Subscription Information
PLMN	Public Land Mobile Network
SAC	Service Area Code
SCF	Service Control Function
SCI	Subscriber Controlled Input or Send Charging Information
SMS	Short Message Service
SS7	Signalling System No. 7
T_CSI	Terminating CAMEL Subscription Information
TDP	Trigger Detection Point
TMN	Telecommunications Management Network
USIM	User Service Identity Module
USSD	Unstructured Supplementary Service Data
UTRAN	UMTS Terrestrial Radio Access Network
VAS	Value Added Service
VLR	Visitor Location Register
VMSC	Visited MSC
VPLMN	Visited PLMN
VT-CSI	Visited Terminating CAMEL Subscription Information

### 3.3 Symbols

Refer to TS 32.200 [22] for applicable symbols.

---

## 4 Record types and contents

The following tables describe the contents of each of the call and event records generated in the CS domain, e.g. by the MSCs (see the example scenarios in TS 32.200 [22]). For each CDR type the field definition includes the field name, description and category.

Equipment vendors shall be able to provide all of the fields listed in the CDR content table in order to claim compliance with this document. However, since CDR processing and transport consume network resources, operators may opt to eliminate some of the fields that are not essential for their operation. This operator provisionable reduction is specified by the field category.

A field category can have one of two primary values:

- M** This field is **Mandatory** and shall always be present in the CDR.
- C** This field shall be present in the CDR only when certain **Conditions** are met.. These **Conditions** are specified as part of the field definition. .

All other fields are designated as **Operator (O)** provisionable which replaced the “Optional” category specified in an earlier release. Using TMN management functions or specific tools provided by an equipment vendor, operators may choose if they wish to include or omit the field from the CDR. Once omitted, this field is not generated in a CDR. To avoid any potential ambiguity, a CDR generating element **MUST** be able to provide all these fields. Only an operator can choose whether or not these fields should be generated in their system.

Those fields that the operator wishes to be present are further divided into a mandatory and conditional categories:

- O<sub>M</sub>** This is a field that, if provisioned by the operator to be present, shall always be included in the CDRs. In other words, an O<sub>M</sub> parameter that is provisioned to be present is a mandatory parameter.

- O<sub>C</sub>** This is a field that, if provisioned by the operator to be present, shall be included in the CDRs when the required conditions are met. In other words, an O<sub>C</sub> parameter that is configured to be present is a conditional parameter.

The content of the CDRs shall be specified on the interface from the core network to the billing system that are used for CDR transport. The rules governing the CDR specifications on these interfaces are summarised in the following subclause.

During a long user session several *Partial CDRs* may be generated for the same session. In this case, some information can be eliminated rather than repeated in all the partial CDRs for that session. Only changes from one CDR to the next, in addition to mandatory information, can be reported. All the missing information can be reconstructed from fields in previous partial CDRs for the session. For example, if the subscriber did not change location, the Reduced Partial CDR would not include any location information.

Two formats are considered for Partial CDRs:

- a *Full Qualified Partial CDR* that contains the Complete CDR Fields, and
- a *Reduced Partial CDR* that contains all the Mandatory fields (**M**) and **ONLY** the changes that occurred in any other field relative to the previous Partial CDR.

The first CDR generated when a session is opened shall be a Full Qualified Partial CDR. Subsequent partial CDRs may be *Reduced Partial CDRs*.

Thus, the convention is that when any non-mandatory field is missing from a Reduced Partial CDR, it should be interpreted that the same field as in the previous partial CDR could be used. Only Mandatory (**M**) fields **MUST** always be included.

The anchor MSC is the creator of the CDRs. The column “2G” indicates a qualifier for the presence of the parameter in a 2G anchor MSC. The column “3G” indicates a qualifier for the presence of the parameter in a 3G anchor MSC.

## 4.1 Mobile originated call attempt

If the generation of these records is enabled then an MOC record shall be created for each outgoing call attempt made by a mobile station. These MOC records shall be produced in the originating MSC.

Table 1: MOC record

Field	2G	3G	Description
Record Type	M	M	Mobile originated.
Served IMSI	M	M	IMSI of the calling party.
Served IMEI	C	C	IMEI of the calling ME, if available.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The primary MSISDN of the calling party.
Called Number	M	M	The address of the called party i.e. the number dialled by the calling subscriber.
Translated Number	O <sub>C</sub>	O <sub>C</sub>	The called number after digit translation within the MSC (if applicable)
Connected Number	O <sub>C</sub>	O <sub>C</sub>	The number of the connected party if different to the Called Number
Roaming Number	O <sub>C</sub>	O <sub>C</sub>	The Mobile Station Roaming Number employed to route this connection, if applicable.
Recording Entity	M	M	The E.164 number of the visited MSC producing the record.
Incoming TKGP	O <sub>M</sub>	O <sub>C</sub>	The MSC trunk group on which the call originated, usually from the BSS. If available in 3G, this parameter shall be supplied.
Outgoing TKGP	O <sub>M</sub>	O <sub>C</sub>	The trunk group on which the call left the MSC. If available in 3G, this parameter shall be supplied.
Location	M	M	The identity of the cell or the SAC at the time of CDR creation, including the location area code.
Change of Location	O <sub>C</sub>	O <sub>C</sub>	A list of changes in Location Area Code / Service Area Code / Cell Id. Each time-stamped.
Basic service	M	M	Bearer or teleservice employed.
Rate Indication	O <sub>C</sub>	O <sub>C</sub>	Present if "rate adaption" parameters for the basic service were signalled between the MS/UE and the network, see TS 24.008.
Transparency Indicator	C	C	Indicates whether the basic service was used in transparent or non-transparent mode. This parameter is provided only for those basic services which may be employed in both transparent and non-transparent mode.
Change Of Service	O <sub>C</sub>	O <sub>C</sub>	A list of changes of basic service during a connection each time-stamped.
Supp. Services	C	C	Supplementary services invoked as a result of this connection. This field shall be present when one or more supplementary services have been invoked.
AOC Parameters	O <sub>C</sub>	O <sub>C</sub>	The charge advice parameters sent to the MS on call set-up. This field shall be supplied only when AoC parameters have been sent.
Change of AOC Parameters	O <sub>C</sub>	O <sub>C</sub>	New AOC parameters sent to the MS e.g. as a result of a tariff switch over, including the time at which the new set was applied. This field shall be supplied only when AoC parameters have been sent.
MS Classmark	M	M	The mobile station classmark employed on call setup.
Change of Classmark	O <sub>C</sub>	O <sub>C</sub>	A list of changes to the classmark during the connection each time-stamped
Event time stamps:	C	C	Seizure time: time of incoming traffic channel seizure (for unsuccessful call attempts)
	C	C	Answer: time of answer (for successful calls)
	O <sub>M</sub>	O <sub>M</sub>	Release time: time of traffic channel release
Call duration	M	M	The chargeable duration of the connection for successful calls, the holding time for call attempts.
Data volume	C	-	The number of data segments transmitted if available at the MSC
Radio Chan. Requested	O <sub>M</sub>	-	The type of radio traffic channel (full / half etc.) requested by the MS.
Radio Chan. Used	M	-	The type of radio channel actually used (full or half rate).
Change of Rad. Chan.	O <sub>C</sub>	-	A list of changes each time stamped
Cause for termination	M	M	The reason for the release of the connection.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call reference	M	M	A local identifier distinguishing between transactions on the same MS
Sequence no.	C	C	Partial record sequence number, only present in case of partial records.
Additional Chg. Info	O <sub>C</sub>	O <sub>C</sub>	Charge/no charge indicator and additional charging parameters, when available.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network / manufacturer specific extensions to the record, when available.
GsmSCF address	C	C	Identifies the CAMEL server serving the subscriber. Shall be present only if CAMEL is applied.
Service key	C	C	The CAMEL service logic to be applied. Shall be present only if CAMEL is applied.
Network call reference	C	C	An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied.

Field	2G	3G	Description
MSC Address	C	C	This field contains the E.164 number assigned to the MSC that generated the network call reference. Shall be present only if CAMEL is applied.
Default call handling	O <sub>C</sub>	O <sub>C</sub>	Indicates whether or not a CAMEL call encountered default call handling. This field shall be present only if default call handling has been applied.
Number of HSCSD Channels Requested	C	-	The maximum number of HSCSD channels requested as received from the MS at call set-up. Shall only be present for HSCSD connections.
Number of HSCSD Channels Allocated	C	-	The number of HSCSD channels allocated to the MS at call set-up. Shall only be present for HSCSD connections.
Change of HSCSD Parameters	C	-	A list of network or user initiated changes of number of HSCSD channels during a connection each timestamped. Shall only be present in case of an HSCSD call, if the basic HSCSD parameters are modified due the user or network initiated modification procedure.
Fixed Network User Rate	O <sub>C</sub>	O <sub>C</sub>	Indicates the user data rate applied for the connection in the fixed network. Shall only be present for 2G HSCSD connections and for UMTS data connections.
Air Interface User Rate Requested	C	-	The total Air Interface User Rate Requested by the MS at call setup. Shall only be present for non-transparent HSCSD connections.
Channel Coding Accepted	C	-	A list of the traffic channels codings accepted by the MS. Shall only be present for HSCSD connections.
Channel Coding Used	C	-	The traffic channels codings negotiated between the MS and the network at call setup. Shall only be present for HSCSD connections.
Speech Version Supported	O <sub>M</sub>	-	Speech version supported by the MS with highest priority indicated by MS
Speech Version Used	O <sub>M</sub>	-	Speech version used for that call
Number of DP encountered	O <sub>C</sub>	O <sub>C</sub>	Number that counts how often armed detection points (TDP and EDP) were encountered. Shall be present only if CAMEL is applied.
Level of CAMEL service	O <sub>C</sub>	O <sub>C</sub>	Indicator for the complexity of the CAMEL feature used. Shall be present only if CAMEL is applied.
Free format Data	C	C	This field contains data sent by the gsmSCF in the Furnish Charging Information (FCI) message(s). The data can be sent either in one FCI message or several FCI messages with append indicator. Shall be present only if CAMEL is applied.
CAMEL call leg information	C	C	Set of CAMEL information IEs. Each of these IEs contains information related to one outgoing CAMEL call leg. Shall be present only if CAMEL is applied.
Free format data append indicator	C	C	Indicator if free format data from this CDR is to be appended to free format data in previous partial CDR. Shall be present only if CAMEL is applied.
Default call handling 2	O <sub>C</sub>	O <sub>C</sub>	Indicates whether or not a CAMEL call encountered default call handling for 2 <sup>nd</sup> service such as dialled service. This field shall be present only if default call handling has been applied.
GsmSCF address 2	C	C	Identifies the CAMEL server serving the subscriber for 2 <sup>nd</sup> service such as dialled service. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Service key 2	C	C	The CAMEL service logic to be applied for 2 <sup>nd</sup> service such as dialled service. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Free format Data 2	C	C	This field contains data sent by the gsmSCF in the FCI message(s) for 2 <sup>nd</sup> service such as dialled service. The data can be sent either in one FCI message or several FCI messages with append indicator. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Free format data append indicator 2	C	C	Indicator if free format data for 2 <sup>nd</sup> service from this CDR is to be appended to free format data in previous partial CDR. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
System Type	-	M	This field indicates the use of GERAN, UTRAN (or a value of unknown). This field is present when either the UTRAN or GERAN air-interface is used on call setup. For an open CDR in a 2G NE (responsible for the CDR), the field is not present (even if the call is handed off to a 3G air interface). For a CDR in a 3G NE (responsible for the CDR), the value unknown shall be used after handover.

## 4.2 Mobile originated emergency call attempt

If the generation of MOC records is enabled then an MOC emergency record shall be created for each outgoing emergency call attempt made by a mobile station. These records shall be produced in the originating MSC.

Table 2: MOC emergency record

Field	2G	3G	Description
Record Type	M	M	Mobile originated.
Served IMSI	C	C	IMSI of the calling party in case of an emergency call with a SIM card.
Served IMEI	C	C	IMEI of the calling mobile equipment if available.
Served MSISDN	O <sub>C</sub>	O <sub>C</sub>	The primary MSISDN of the calling party, if supplied by the UE.
Translated Number	O <sub>C</sub>	O <sub>C</sub>	The called number after digit translation within the MSC (if applicable)
Recording Entity	M	M	The E.164 number of the visited MSC producing the record.
Incoming TKGP	O <sub>M</sub>	O <sub>C</sub>	The MSC trunk group on which the call originated, usually from the BSS. If available in 3G, this parameter shall be supplied.
Outgoing TKGP	O <sub>M</sub>	O <sub>C</sub>	The trunk group on which the call left the MSC. If available in 3G, this parameter shall be supplied.
Location	M	M	The identity of the cell or the SAC in which the call originated including the location area code.
Change of Location	O <sub>C</sub>	O <sub>C</sub>	A list of changes in Location Area Code / Service Area Code / Cell Id. Each time-stamped.
Basic service	M	M	Teleservice 'emergency call'.
AOC Parameters	O <sub>C</sub>	O <sub>C</sub>	The charge advice parameters sent to the MS on call set-up. This field shall be supplied only when AoC parameters have been sent.
Change of AOC Parameters	O <sub>C</sub>	O <sub>C</sub>	New AOC parameters sent to the MS e.g. as a result of a tariff switch over, including the time at which the new set was applied. This field shall be supplied only when AoC parameters have been sent.
MS Classmark	M	M	The mobile station classmark employed on call set-up.
Change of classmark	O <sub>C</sub>	O <sub>C</sub>	A list of changes to the classmark during the connection each time-stamped
Event time stamps:	C	C	Seizure time: time of incoming traffic channel seizure (for unsuccessful call attempts)
	C	C	Answer time: time of answer (for successful calls)
	O <sub>M</sub>	O <sub>M</sub>	Release time: time of traffic channel release
Call duration	M	M	The chargeable duration of the connection for successful calls, the holding time for call attempts.
Radio Chan. Requested	O <sub>M</sub>	-	The type of radio traffic channel (full / half etc.) requested by the MS.
Radio Chan. Used	M	-	The type of radio channel used (full or half rate).
Change of Rad. Chan.	O <sub>C</sub>	-	A list of changes each time stamped
Cause for termination	M	M	The reason for the release of the connection.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call reference	M	M	A local identifier distinguishing between transactions on the same MS
Sequence no.	C	C	Partial record sequence number, only present in case of partial records.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
System Type		M	This field indicates the use of GERAN, UTRAN (or a value of unknown). This field is present when either the UTRAN or GERAN air-interface is used on call setup. For an open CDR in a 2G NE (responsible for the CDR), the field is not present (even if the call is handed off to a 3G air interface). For a CDR in a 3G NE (responsible for the CDR), the value unknown shall be used after handover.

### 4.3 Mobile originated call forwarding attempt

If the generation of MOC records is enabled in the forwarding MSC then the forwarding MSC shall produce an MOC record for the forwarded-leg of the call.

Table 3: MOC, call forwarding record

Field	2G	3G	Description
Record Type	M	M	Mobile originated.
Served IMSI	M	M	IMSI of the calling party.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The MSISDN of the forwarding party.
Calling Number	O <sub>M</sub>	O <sub>M</sub>	The address of the calling party.
Called Number	M	M	The address of the "forwarded-to" party.
Translated Number	O <sub>C</sub>	O <sub>C</sub>	The called number after digit translation within the MSC (if applicable)
Connected Number	O <sub>C</sub>	O <sub>C</sub>	The number of the connected party if different to the Called Number
Roaming Number	O <sub>C</sub>	O <sub>C</sub>	The Mobile Station Roaming Number employed to route this connection, if applicable.
Recording Entity	M	M	The E.164 number of the forwarding MSC
Incoming TKGP	O <sub>M</sub>	O <sub>M</sub>	The MSC trunk group on which the call originated at the forwarding MSC.
Outgoing TKGP	O <sub>M</sub>	O <sub>M</sub>	The trunk group on which the call left the forwarding MSC
Basic service	C	C	Bearer or teleservice employed, not always available e.g. in case of call forwarding unconditional.
Rate Adaptation	O <sub>C</sub>	O <sub>C</sub>	Present if "rate adaption" parameters for the basic service were signalled between the MS/UE and the network, see TS 24.008. May not always be available in this CDR type.
Transparency Indicator	C	C	Indicates whether the basic service was used in transparent or non-transparent mode. This parameter is provided only for those basic services which may be employed in both transparent and non-transparent mode.
Fixed Network User Rate	O <sub>C</sub>	O <sub>C</sub>	Indicates the user data rate applied for the connection in the fixed network. Shall only be present for 2G HSCSD connections and for UMTS data connections.
ChangeOfService	O <sub>C</sub>	O <sub>C</sub>	A list of changes of basic service during a connection each time-stamped.
Supplementary Services	C	C	Supplementary services invoked as a result of this connection, if this information is available to the forwarding node. This field shall be present when one or more supplementary services have been invoked.
Event time stamps:	C C O <sub>M</sub>	C C O <sub>M</sub>	Seizure time: time of incoming traffic channel seizure (for unsuccessful call attempts) Answer time: time of answer (for successful calls) Release time: time of traffic channel release
Call duration	M	M	The chargeable duration of the connection for successful calls, the holding time of call attempts.
Data volume	C	-	The number of data segments transmitted if available at the MSC
Cause for termination	M	M	The reason for the release of the connection.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call reference	M	M	A local identifier distinguishing between transactions on the same MS
Sequence no.	C	C	Partial record sequence number, only present in case of partial records.
Additional Chg. Info	O <sub>C</sub>	O	Charge/no charge indicator and additional charging parameters, when available.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
GsmSCF address	C	C	Identifies the CAMEL server serving the subscriber. Shall be present only if CAMEL is applied.
Service key	C	C	The CAMEL service logic to be applied. Shall be present only if CAMEL is applied.
Network call reference	C	C	An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied.
MSC Address	C	C	This field contains the E.164 number assigned to the MSC that generated the network call reference. Shall be present only if CAMEL is applied.
CAMEL initiated CF indicator	C	C	Indicates that the CAMEL server initiated call forwarding. Shall be present only if CAMEL is applied.
Default call handling	O <sub>C</sub>	O <sub>C</sub>	Indicates whether or not a CAMEL call encountered default call handling. This field shall be present only if default call handling has been applied.
Number of DP encountered	O <sub>C</sub>	O <sub>C</sub>	Number that counts how often armed detection points (TDP and EDP) were encountered. Shall be present only if CAMEL is applied.
Level of CAMEL service	O <sub>C</sub>	O <sub>C</sub>	Indicator of the complexity of the CAMEL feature used. Shall be present only if CAMEL is applied.
Free format Data	C	C	This field contains data sent by the gsmSCF in the Furnish Charging Information (FCI) messages. The data can be sent either in one FCI message or several FCI messages with append indicator. Shall be present only if CAMEL is applied.
CAMEL call leg information	C	C	Set of CAMEL information IEs. Each of these IEs contains information related to one outgoing CAMEL call leg. Shall be present only if CAMEL is applied.

Field	2G	3G	Description
Free format data append indicator	C	C	Indicator if free format data from this CDR is to be appended to free format data in previous partial CDR. Shall be present only if CAMEL is applied.
Default call handling 2	O <sub>C</sub>	O <sub>C</sub>	Indicates whether or not a CAMEL call encountered default call handling for 2 <sup>nd</sup> service such as dialled service. This field shall be present only if default call handling has been applied.
GsmSCF address 2	C	C	Identifies the CAMEL server serving the subscriber for 2 <sup>nd</sup> service such as dialled service. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Service key 2	C	C	The CAMEL service logic to be applied for 2 <sup>nd</sup> service such as dialled service. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Free format Data 2	C	C	This field contains data sent by the gsmSCF in the FCI message(s) for 2 <sup>nd</sup> service such as dialled service. The data can be sent either in one FCI message or several FCI messages with append indicator. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Free format data append indicator 2	C	C	Indicator if free format data for 2 <sup>nd</sup> service from this CDR is to be appended to free format data in previous partial CDR. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.

## 4.4 Mobile terminated call attempt

If the generation of these records is enabled, then an MTC record shall be created for each incoming call attempt made for a mobile station. The MTC records shall be produced in the terminating MSC.

Table 4: MTC record

Field	2G	3G	Description
Record Type	M	M	Mobile Terminated.
Served IMSI	M	M	IMSI of the called party.
Served IMEI	C	C	IMEI of the called ME, if available.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The MSISDN of the called party.
Calling Number	C	C	The number of the calling party if available.
Connected Number	O <sub>C</sub>	O <sub>C</sub>	Only relevant in case of call forwarding where the "forwarded-to" number is recorded.
Recording Entity	M	M	The E.164 number of the visited (terminating) MSC
Incoming TKGP	O <sub>M</sub>	O <sub>M</sub>	The MSC trunk group on which the call originated.
Outgoing TKGP	O <sub>M</sub>	O <sub>C</sub>	The trunk group on which the call left the MSC, usually to the BSS. If available in 3G, this parameter shall be supplied.
Location	C	C	The identity of the cell or the SAC occupied by the called party when the call was set up, including the location area code.
Change of Location	O <sub>C</sub>	O <sub>C</sub>	A list of changes in Location Area Code / Service Area Code / Cell Id. Each time-stamped.
Basic Service	M	M	Bearer or teleservice employed
Rate Adaptation	O <sub>C</sub>	O <sub>C</sub>	Present if "rate adaption" parameters for the basic service were signalled between the MS/UE and the network, see TS 24.008.
Transparency Indicator	C	C	Indicates whether the basic service was used in transparent or non-transparent mode. This parameter is provided only for those basic services which may be employed in both transparent and non-transparent mode.
Change of Service	O <sub>C</sub>	O <sub>C</sub>	A list of changes of basic service during a connection each time-stamped.
Supplementary services	C	C	Supplementary services invoked as a result of this connection. This field shall be present when one or more supplementary services have been invoked.
AOC Parameters	O <sub>C</sub>	O <sub>C</sub>	The charge advice parameters sent to the MS on call set-up. This field shall be supplied only when AoC parameters have been sent.
Change of AOC Parameters.	O <sub>C</sub>	O <sub>C</sub>	New AOC parameters sent to the MS e.g. as a result of a tariff switch-over, including the time at which the new set was applied. This field shall be supplied only when AoC parameters have been sent.
MS Classmark	M	M	The mobile station class mark.
Change of Classmark	O <sub>C</sub>	O <sub>C</sub>	A list of changes to the classmark during the connection each time-stamped
Event time stamps:	C C O <sub>M</sub>	C C O <sub>M</sub>	Seizure time: time of traffic channel seizure for unsuccessful call attempts Answer time: time of answer for successful calls Release time: time of traffic channel release
Call duration	M	M	The chargeable duration of the connection if successful, the holding time of the call if unsuccessful.
Data volume	C	-	The number of data segments transmitted, if available at the MSC
Radio Chan. Requested	O <sub>M</sub>	-	The type of radio traffic channel (full / half etc.) requested by the MS.
Radio Chan. Used	M	-	The type of radio channel used (full or half rate).
Change of Rad. Chan	O <sub>C</sub>	-	A list of changes each time stamped
Cause for termination	M	M	The reason for the release of the call.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call reference	M	M	A local identifier distinguishing between transactions at the same MS
Sequence no.	C	C	Partial record sequence number, only present in case of partial records.
Additional Chg. Info	O <sub>C</sub>	O <sub>C</sub>	Charge/no charge indicator and additional charging parameters, when available.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
Network call reference	C	C	An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied.
MSC Address	C	C	This field contains the E.164 number assigned to the MSC that generated the network call reference. Shall be present only if CAMEL is applied.
Number of HSCSD Channels Requested	O <sub>C</sub>	-	The maximum number of HSCSD channels requested as received from the MS at call set-up. Shall only be present for HSCSD connections.
Number of HSCSD Channels Allocated	O <sub>C</sub>	-	The number of HSCSD channels allocated to the MS at call set-up. Shall only be present for HSCSD connections.
Change of HSCSD Parameters	O <sub>C</sub>	-	A list of network or user initiated changes of number of HSCSD channels during a connection each timestamped. Shall only be present in case of an HSCSD call, if the basic HSCSD parameters are modified due the user or network initiated modification procedure.

Fixed Network User Rate	O <sub>C</sub>	-	Indicates the user data rate applied for the connection in the fixed network. Shall only be present for 2G HSCSD connections and for UMTS data connections.
Air Interface User Rate Requested	C	C	The total Air Interface User Rate Requested by the MS at call setup. Shall only be present for non-transparent HSCSD connections.
Channel Coding Accepted	C	-	A list of the traffic channels codings accepted by the MS. Shall only be present for HSCSD connections.
Channel Coding Used	C	-	The traffic channels codings negotiated between the MS and the network at call setup. Shall only be present for HSCSD connections.
Speech Version Used	O <sub>M</sub>	-	Speech version used for that call
Speech Version Supported	O <sub>M</sub>	-	Speech version supported by the MS with highest priority indicated by MS
System Type	-	M	This field indicates the use of GERAN, UTRAN (or a value of unknown). This field is present when either the UTRAN or GERAN air-interface is used on call setup. For an open CDR in a 2G NE (responsible for the CDR), the field is not present (even if the call is handed off to a 3G air interface). For a CDR in a 3G NE (responsible for the CDR), the value unknown shall be used after handover.

## 4.5 Roaming call attempt

If the generation of these records is enabled then, a roaming record shall be created for each call redirected to a mobile subscriber roaming outside the HPLMN. These roaming records shall be produced in the GMSC of the roaming subscriber's HPLMN.

**Table 5: Roaming record**

Field	2G	3G	Description
Record Type	M	M	Roaming record.
Served IMSI	M	M	IMSI of the called (roaming) party.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The MSISDN of the called (roaming) party.
Calling Number	C	C	The address of the calling party, if available.
Roaming Number	M	M	The Mobile Station Roaming Number employed to route this connection.
Recording Entity	M	M	The E.164 number of the GMSC
Incoming TKGP	O <sub>M</sub>	O <sub>M</sub>	The GMSC trunk group on which the call originated.
Outgoing TKGP	O <sub>M</sub>	O <sub>M</sub>	The trunk group on which the call left the GMSC
Basic service	M	M	Bearer or teleservice employed.
Transparency Indicator	C	C	Indicates whether the basic service was used in transparent or non-transparent mode. This parameter is provided only for those basic services which may be employed in both transparent and non-transparent mode.
ChangeOfService	O <sub>C</sub>	O <sub>C</sub>	A list of changes of basic service during a connection each time-stamped.
Supplementary Services	C	C	Supplementary services invoked as a result of this connection. This field shall be present when one or more supplementary services have been invoked.
Event time stamps	C C O <sub>M</sub>	C C O <sub>M</sub>	Seizure time: time of incoming traffic channel seizure (for unsuccessful call attempts) Answer time: time of answer (for successful calls) Release time: time of traffic channel release
Call duration	M	M	The chargeable duration of the connection for successful calls, the holding time of call attempts.
Data volume	C	C	The number of data segments transmitted if available at the GMSC
Cause for termination	M	M	The reason for the release of the connection.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call reference	M	M	A local identifier distinguishing between transactions on the same MS
Sequence no.	C	C	Partial record sequence number, only present in case of partial records.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
Network call reference	C	C	An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied.
MSC Address	C	C	This field contains the E.164 number assigned to the MSC that generated the network call reference. Shall be present only if CAMEL is applied.

## 4.6 Incoming gateway call attempt

If generation of these records is enabled, an incoming gateway record shall be created for each incoming call attempt received by a gateway MSC from another network. These records, produced in the gateway MSC, may be used to settle accounts with other networks. The generation of gateway records shall not be influenced by the production of MTC records i.e. even if the GMSC and terminating MSC are co-located a gateway record shall still be produced.

**Table 6: Incoming gateway record**

Field	2G	3G	Description
Record Type	M	M	Incoming gateway record
Calling Number	C	C	The number of the calling party if available at this node.
Called Number	M	M	The address of the called party as seen by the GMSC. This is the number employed by the GMSC for routing.
Recording Entity	M	M	The E.164 number of the GMSC
Incoming TKGP	M	M	The incoming GMSC trunk group on which the call originated.
Outgoing TKGP	O <sub>M</sub>	O <sub>C</sub>	The trunk group on which the call left the GMSC. If available in 3G, this parameter shall be supplied.
Event time stamps:	M C O <sub>M</sub>	M C O <sub>M</sub>	Seizure time: time of incoming trunk seizure Answer time: time of answer (successful calls only) Release time: time of incoming trunk release
Call duration	M	M	The accountable duration (answer -> release of incoming trunk) of the connection if successful, the call holding time of the incoming trunk for call attempts.
Data Volume	C	-	If applicable and known at the GMSC
Cause for termination	M	M	The reason for the release of the connection.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call Reference	M	M	A local identifier distinguishing between transactions.
Sequence no.	C	C	Partial record sequence number, if applicable.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.

## 4.7 Outgoing gateway call attempt

If generation of these records is enabled, an outgoing gateway record shall be created for each outgoing call attempt from a gateway MSC to another network. These records, produced in the gateway MSC, may be used to settle accounts with other networks. The generation of gateway records shall not be influenced by the production of MOC records i.e. even if the GMSC and originating MSC are co-located a gateway record shall still be produced.

Table 7: Outgoing gateway record

Field	2G	3G	Description
Record Type	M	M	Outgoing gateway record
Calling Number	C	C	The number of the calling party if available at this node.
Called Number	M	M	The address of the called party as seen by the GMSC. This is the number employed by the GMSC for routing.
Recording Entity	M	M	The E.164 number of the GMSC
Incoming TKGP	O <sub>M</sub>	O <sub>C</sub>	The incoming GMSC trunk group on which the call originated. If available in 3G, this parameter shall be supplied.
Outgoing TKGP	M	M	The trunk group on which the call left the GMSC.
Event time stamps:	M C O <sub>M</sub>	M C O <sub>M</sub>	Seizure time: time of outgoing trunk seizure Answer time: time of answer (successful calls only) Release time: time of outgoing trunk release
Call duration	M	M	The accountable duration (answer -> release of outgoing trunk) of the connection if successful, the call holding time of the outgoing trunk for call attempts.
Data Volume	C	-	If applicable and known at the GMSC
Cause for termination	M	M	The reason for the release of the connection.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call Reference	M	M	A local identifier distinguishing between transactions.
Sequence no.	C	C	Partial record sequence number, if applicable.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.

## 4.8 Transit call attempt

If generation of these records is enabled then a transit record may be generated for each incoming call attempt received by a Transit MSC i.e. neither originating nor terminating. For the avoidance of doubt, a transit record shall only be produced if no MOC or MTC record is produced for this call attempt by this MSC. The transit records, produced in the TMSC, may be used to record traffic from particular origins or to particular destinations.

Table 8: Transit record

Field	2G	3G	Description
Record Type	M	M	Transit.
Recording Entity	M	M	The E.164 number of the transit MSC
Incoming TKGP	M	M	The TMSC trunk group on which the call originated.
Outgoing TKGP	M	M	The trunk group on which the call left the TMSC.
Calling Number	C	C	The number of the calling party if available at this node.
Called Number	M	M	The address of the called party as seen by the TMSC.
ISDN Basic Service	O <sub>M</sub>	O <sub>M</sub>	The ISDN basic service employed
Event time stamps:	C C O <sub>M</sub>	C C O <sub>M</sub>	Seizure time: time of incoming trunk seizure for unsuccessful call attempts Answer time: time of answer (successful calls only) Release time: time of traffic channel release
Call duration	M	M	The chargeable duration of the connection if successful, the call holding time for call attempts.
Data Volume	C	-	If applicable and known at the transit MSC
Cause for term.	M	M	The reason for the release of the connection.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call Reference	M	M	A local identifier distinguishing between transactions.
Sequence no.	C	C	Partial record sequence number, if applicable.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.

## 4.9 Supplementary service actions

A supplementary service record may be produced in the NEF of the appropriate MSC or HLR for each supplementary service action (activation, deactivation, invocation etc.) performed or initiated by the subscriber.

- There are two fundamental types of SS-actions: Call related i.e. as a result of a connection e.g. Invocation of CLIP / CLIR / AOC etc.
- Non-call related i.e. as a result of subscriber controlled input (SCI) e.g. Registration of call forwarding

Each supplementary service action shall be performed on one or more basic service groups. If the action applies to all teleservices and all bearer services (i.e. to all basic services) then the basic services field shall be omitted.

SCI actions may be recorded in individual SS-action records. Call related actions may be recorded in either the appropriate call record (MOC/MTC) or in separate SS-action records.

Additional non-standard supplementary service actions may be made available within some networks in the form of Unstructured Supplementary Service Data (USSD). These actions may also be recorded in SS-action records. However, as these actions are non-standard they may not include an appropriate action type, supplementary service code or basic service code.

**Table 9: SS-action record**

Field	2G	3G	Description
Record Type	M	M	Supplementary service action.
Served IMSI	M	M	The IMSI of the MS performing the action.
Served IMEI	O <sub>C</sub>	O <sub>C</sub>	The IMEI of the ME performing the action.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The primary MSISDN of the party performing the action.
MS Classmark	M	M	The mobile station classmark.
Recording Entity	M	M	The E.164 number of the visited MSC / HLR.
Location	O <sub>M</sub>	O <sub>M</sub>	The identity of the cell or the SAC, including the location area code, from which the request originated.
Basic Services	C	C	The basic service group(s) to which the supplementary service applies. This field is not provided if the action applies to all basic services.
Supplementary Service	C	C	The supplementary service or group of supplementary services for which the request was made. May not be available in case of USSD.
SS Action	C	C	Activation, deactivation, interrogation etc. May not be available in case of USSD.
SS Action time stamp	M	M	The time at which the action was requested.
SS Parameters	C	C	Service dependent parameters or unstructured supplementary service data, if defined for the SS action recorded in this CDR.
SS Action Result	C	C	Result of the requested transaction if unsuccessful.
Call Reference	M	M	A local identifier distinguishing between transactions at the same MS.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
System Type	-	M	This field is present when either the UTRAN or GERAN air-interface is used. It is omitted when the service is provided by a GSM air interface

## 4.10 HLR interrogation

If enabled, a HLR interrogation record shall be created for each interrogation performed for a mobile subscriber. These records may be produced in either the HLR itself or the interrogating MSC.

**Table 10 : HLR interrogation record**

Field	2G	3G	Description
Record Type	M	M	HLR interrogation.
Served IMSI	C	C	The IMSI of the party being interrogated, if successful
Served MSISDN	M	M	The MSISDN of the subscriber being interrogated.
Recording Entity	M	M	The E.164 Number of the HLR / MSC.
Basic Service	O <sub>C</sub>	O <sub>C</sub>	Only for teleservice 21 (SMS-MT).
Routing Number	C	C	Routing number (MSRN, forwarding no.) provided by the HLR if the interrogation was successful.
Interrogation time stamp	M	M	Time at which the interrogation was invoked.
Number of Forwarding	C	C	The number of times the call has been forwarded if provided by ISUP.
Interrogation Result	C	C	The result of the interrogation request if unsuccessful.

Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
-------------------	----------------	----------------	---

## 4.11 Location update (VLR)

If enabled, a VLR location update record shall be produced in the VLR for each location registration or location update received by the VLR for a mobile subscriber.

**Table 11: Location update (VLR) record**

Field	2G	3G	Description
Record Type	M	M	Location update.
Served IMSI	M	M	IMSI of the served MS.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The primary MSISDN of the party performing the location update
Recording Entity	M	M	The E.164 number of the entity (VLR or MSC/VLR) generating the record.
Old location			Not present for registration:
	C	C	VMSC E.164 Number
	C	C	Location Area Code
New location			VMSC E.164 Number
	M	M	Location Area Code
	O <sub>M</sub>	O <sub>M</sub>	Cell Identification or Service Area Code
MS Classmark	M	M	The mobile station classmark.
Update time stamp	M	M	Time at which the update was invoked.
Update Result	C	C	The result of the location update if unsuccessful.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.

## 4.12 Location update (HLR)

If enabled, an HLR location update record shall be produced in the HLR for each location registration or location update received by the HLR for a mobile subscriber including location updates received from subscribers roaming in foreign PLMNs.

**Table 12: Location Update (HLR) record**

Field	2G	3G	Description
Record Type	M	M	Location update.
Served IMSI	M	M	IMSI of the served MS.
Recording Entity	M	M	The E.164 Number of the HLR.
Old location			VMSC E.164 Number
	O <sub>C</sub>	O <sub>C</sub>	VLR E.164 Number
New location			VMSC E.164 Number
	M	M	VLR E.164 Number
Update time stamp	M	M	Time at which the update was invoked.
Update Result	C	C	The result of the location update if unsuccessful.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.

## 4.13 Short message service, mobile originated

If enabled, an SMS-MO record shall be produced, within the originating MSC, for each short message sent by a mobile subscriber.

**Table 13: SMS-MO record**

Field	2G	3G	Description
-------	----	----	-------------

Record Type	M	M	SMS-Mobile originated.
Served IMSI	M	M	The IMSI of the subscriber sending the short message.
Served IMEI	O <sub>C</sub>	O <sub>C</sub>	The IMEI of the ME sending the message, if available.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The primary MSISDN of the subscriber sending the message.
MS Classmark	M	M	The mobile station classmark.
Service Centre	M	M	The address (E.164) of the SMS-service centre.
Recording Entity	M	M	The E.164 number of the visited MSC
Location	O <sub>M</sub>	O <sub>M</sub>	The Location Area Code and Cell Identity / Service Area Code from which the message originated.
Event Time stamp	M	M	Origination time: The time at which the message was received by the MSC from the subscriber.
Message Reference	M	M	A reference, provided by the MS uniquely identifying this message.
SMS Result	C	C	The result of the attempted delivery if unsuccessful.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
Destination number	O <sub>M</sub>	O <sub>M</sub>	The destination number dialled by the MS sending the short message.
CAMELSMSInformation	C	C	Set of CAMEL information IEs. Each of these IEs contains information related to CAMEL call leg related for the SMS. Shall be present only if CAMEL is applied.
System Type	-	M	This field indicates the use of GERAN, UTRAN (or a value of unknown). This field is present when either the UTRAN or GERAN air-interface is used on call setup. For an open CDR in a 2G NE (responsible for the CDR), the field is not present (even if the call is handed off to a 3G air interface). For a CDR in a 3G NE (responsible for the CDR), the value unknown shall be used after handover.

## 4.14 Short message service, mobile terminated

If enabled, an SMS-MT record shall be produced, within the terminating MSC, for each short message received by a mobile subscriber.

**Table 14: SMS-MT record**

Field			Description
Record Type	M	M	SMS-Mobile Terminated.
Service Centre	M	M	The E.164 address of the SMS centre.
Served IMSI	M	M	The IMSI of the receiving party.
Served IMEI	O <sub>C</sub>	O <sub>C</sub>	The IMEI of the receiving party, if available.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The MSISDN of the receiving party.
MS Classmark	M	C	The mobile station classmark.
Recording Entity	M	M	The E.164 number of the visited MSC.
Location	O <sub>M</sub>	O <sub>M</sub>	The Location Area Code and Cell Identity /Service Area Code to which the message was delivered.
Event time stamp	M	M	Delivery time: time at which message was sent to the MS by the MSC.
SMS Result	C	C	The result of the attempted delivery if unsuccessful.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
System Type	C	M	This field is present when either the UTRAN or GERAN air-interface is used. It is omitted when the service is provided by a GSM air interface

## 4.15 SMS-MO interworking record

If enabled, an SMS-MO interworking record shall be produced, within the interworking MSC, for each short message generated by a mobile subscriber. These records may be used to settle accounts between PLMNs and SMS service centres. Where the Interworking MSC is also the originating MSC, an SMS-MO CDR will also be generated.

**Table 15: SMS-MO interworking record**

Field	2G	3G	Description
Record Type	M	M	SMS-MO interworking record.
Service Centre	M	M	The E.164 address of the SMS service centre.
Served IMSI	M	M	The IMSI of the sending party.
Recording Entity	M	M	The E.164 number of the visited MSC.
Event Time stamp	M	M	The time at which the message was received by the interworking function.
SMS Result	C	C	The result of the attempted delivery if unsuccessful, when available.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record.

## 4.16 SMS-MT gateway record

If enabled, an SMS-MT gateway record shall be produced, within the gateway MSC, for each short message sent to a mobile subscriber. Where the Gateway MSC is also the terminating MSC, an SMS-MT CDR will also be generated.

**Table 16: SMS-MT gateway record**

Field	2G	3G	Description
Record Type	M	M	SMS-MT gateway record.
Service Centre	M	M	The E.164 address of the SMS service centre.
Served IMSI	M	M	The IMSI of the receiving party.
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The MSISDN of the receiving party.
Recording Entity	M	M	The E.164 number of the visited MSC.
Event Time stamp	M	M	The time at which the message was received by the gateway.
SMS Result	C	C	The result of the attempted delivery if unsuccessful.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.

## 4.17 Common equipment usage record

If enabled, a common equipment usage record shall be created in the VMSC to record the usage (duration) of common equipment, e.g. conference circuits, employed by a mobile subscriber.

**Table 17: Common equipment usage record**

Field	2G	3G	Description
Record Type	M	M	Common equipment usage record.
Equipment type	M	M	e.g. Conference circuit.
Equipment Id.	C	C	The local id. Of the equipment employed.
Served IMSI	M	M	The IMSI of the party responsible for the seizure of the equipment..
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The primary MSISDN of the served party..
Recording Entity	M	M	The E.164 number of the MSC in which the equipment is located.
Basic service	C	C	Bearer or teleservice employed, if appropriate.
Rate Adaptation	O <sub>C</sub>	O <sub>C</sub>	Present if "rate adaption" parameters for the basic service were signalled between the MS/UE and the network, see TS 24.008.
Fixed Network User Rate	O <sub>C</sub>	O <sub>C</sub>	Indicates the user data rate applied for the connection in the fixed network. Shall only be present for 2G HSCSD connections and for UMTS data connections.
ChangeOfService	O <sub>C</sub>	O <sub>C</sub>	A list of changes of basic service during a connection each time-stamped.
Supp. Services	C	C	Supplementary services invoked in connection with this equipment.
Event Time Stamp	M	M	Seizure time: the time at which the equipment was seized.
	O <sub>M</sub>	O <sub>M</sub>	Release time: the time at which the equipment was released.
Call Duration	M	M	The total duration of the usage of the equipment.
Call Reference	M	M	A local identifier distinguishing between transactions.
Sequence no.	C	C	Partial record sequence number if applicable.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.

System Type	-	M	This field indicates the use of GERAN, UTRAN (or a value of unknown). This field is present when either the UTRAN or GERAN air-interface is used on call setup. For an open CDR in a 2G NE (responsible for the CDR), the field is not present (even if the call is handed off to a 3G air interface). For a CDR in a 3G NE (responsible for the CDR), the value unknown shall be used after handover.
-------------	---	---	--

## 4.18 Terminating CAMEL call attempt

If the generation of these records is enabled, a terminating CAMEL call attempt record shall be generated for each call toward a subscriber with a T-CSI or VT-CSI and if the terminating trigger criteria are met. The record is generated in the GMSC/gsmSSF carrying out the terminating CAMEL call handling and in the MSC server/gsmSSF carrying out the visited terminating CAMEL call attempt.

**Table 18: Terminating CAMEL record**

Field	2G	3G	Description
Record Type	M	M	Terminating CAMEL interrogation.
Served IMSI	M	M	IMSI of the called party
Served MSISDN	O <sub>M</sub>	O <sub>M</sub>	The MSISDN of the called party.
Recording Entity	M	M	The E.164 number of the GMSC.
Interrogation time stamp	M	M	Time at which the interrogation was invoked.
CAMEL Destination Number	M	M	The number available for routing after the CAMEL server enquiry.
GsmSCF Address	M	M	The CAMEL server serving the subscriber.
Service key	M	M	The CAMEL service logic to be applied.
Network call reference	M	M	An identifier to correlate transactions on the same call taking place in different network nodes.
MSC Address	M	M	This field contains the E.164 number assigned to the MSC that generated the network call reference.
Default call handling	O <sub>C</sub>	O <sub>C</sub>	Indicates whether or not a CAMEL call encountered default call handling. This field shall be present only if default call handling has been applied.
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.
Called Number	M	M	The address of the called party as received by the GMSC/gsmSSF.
Calling Number	C	C	The address of the calling party, if available.
Incoming TKGP	O <sub>M</sub>	O <sub>C</sub>	The GMSC trunk group on which the call originated. If available in 3G, this parameter shall be supplied.
Outgoing TKGP	O <sub>M</sub>	O <sub>C</sub>	The trunk group on which the call left the GMSC. If available in 3G, this parameter shall be supplied.
Event time stamps:	C C O <sub>M</sub>	C C O <sub>M</sub>	Seizure time: time of incoming traffic channel seizure (for unsuccessful call attempts) Answer time: time of answer (for successful calls) Release time: time of traffic channel release
Call duration	M	M	The chargeable duration of the connection for successful calls, the holding time of call attempts.
Data volume	C	-	The number of data segments transmitted if available at the GMSC
Cause for termination	M	M	The reason for the release of the connection.
Diagnostics	O <sub>M</sub>	O <sub>M</sub>	A more detailed reason for the release of the connection.
Call reference	M	M	A local identifier distinguishing between transactions on the same MS
Sequence no.	C	C	Partial record sequence number, only present in case of partial records.
Number of DP encountered	O <sub>C</sub>	O <sub>C</sub>	Number that counts how often armed detection points (TDP and EDP) were encountered.
Level of CAMEL service	O <sub>C</sub>	O <sub>C</sub>	Indicator of the complexity of the CAMEL feature used.
Free format Data	C	C	This field contains data sent by the gsmSCF in the Furnish Charging Information (FCI) message(s). The data can be sent either in one FCI message or several FCI messages with append indicator.
CAMEL call leg information	C	C	Set of CAMEL information IEs. Each of these IEs contains information related to one outgoing CAMEL call leg.
Free format data append indicator	C	C	Indicator if free format data from this CDR is to be appended to free format data in previous partial CDR.

MSC server indication	C	C	Indication if the CAMEL call handling is active in the MSC server.
Default call handling 2	O <sub>C</sub>	O <sub>C</sub>	Indicates whether or not a CAMEL call encountered default call handling for 2 <sup>nd</sup> service such as dialled service. This field shall be present only if default call handling has been applied.
GsmSCF address 2	C	C	Identifies the CAMEL server serving the subscriber for 2 <sup>nd</sup> service such as dialled service. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Service key 2	C	C	The CAMEL service logic to be applied for 2 <sup>nd</sup> service such as dialled service. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Free format Data 2	C	C	This field contains data sent by the gsmSCF in the FCI message(s) for 2 <sup>nd</sup> service such as dialled service. The data can be sent either in one FCI message or several FCI messages with append indicator. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.
Free format data append indicator 2	C	C	Indicator if free format data for 2 <sup>nd</sup> service from this CDR is to be appended to free format data in previous partial CDR. Shall be present only if CAMEL is applied for 2 <sup>nd</sup> service.

## 4.19 IMEI observation ticket

An observed IMEI ticket is generated whenever greylisted, blacklisted or non-whitelisted mobile equipment is detected during an IMEI check. The purpose of the ticket is to link the mobile equipment under observation with its current user (IMSI). The ticket also includes information describing when and where the equipment was used to enable the tracking of such equipment. Finally, if the ticket was triggered by a call attempt, a call reference is provided in order to locate the corresponding call record.

The IMEI tickets are generated by the NEF of the MSC performing the IMEI check.

**Table 19: IMEI ticket**

Field	2G	3G	Description
Served IMEI	M	M	IMEI of the observed mobile equipment
IMEI Status	M	M	The result of the IMEI check e.g. blacklisted, greylisted, unknown.
Served IMSI	M	M	The IMSI of the subscriber currently using the mobile equipment.
Served MSISDN	C	C	The MSISDN of the subscriber currently using the observed mobile equipment, only available if the event that triggered the IMEI check was an MOC, MTC, SMS-MO or SMS-MT
Recording Entity	M	M	The E.164 number of the recording MSC.
Event Time Stamp	M	M	The time at which the IMEI check was performed.
Location	M	M	The location area code and cell identity of the cell from which the mobile equipment was used.
IMEI Check Event	O <sub>M</sub>	O <sub>M</sub>	The event that caused IMEI checking to take place
Call Reference	O <sub>C</sub>	O <sub>C</sub>	Only available if the IMEI check was related to an MOC or MTC
Record extensions	O <sub>C</sub>	O <sub>C</sub>	A set of network/ manufacturer specific extensions to the record, when available.

## 5 Description of Record Fields

This subclause contains a brief description of each field of the CDRs described in the previous subclause.

### 5.1 Additional Charging Information

This field consists of two parts, a charge indicator and additional charging parameters. The charge indicator is derived from the information contained within the ISUP "backward call indicator" and may be used to store a charge indicator (charge/no charge) received from another network node. The additional charging parameters are non-standard and intended to permit the inclusion of further charging information received from Intelligent Network and/or Value Added Service nodes.

## 5.2 AoC parameters / change of AoC parameters

The AoC parameter field contains the set of charge advice (AoC) parameters sent to the MS on call set-up. If further sets of parameters are sent during the call, as a result of a tariff switch-over for example, then this may be recorded in the Change of AoC Parameter field including the time at which the change occurred.

It should be noted that the Change of AoC Parms. field is optional and not required if partial records are generated on tariff switch-over.

The AoC parameters are defined in TS 22.024 [10].

## 5.3 Basic Service / change of service / ISDN Basic Service

The basic service field contains the code of the basic service employed on call set-up. Any alteration to the basic service during the connection may be recorded in the change of service field including the time at which the change took place.

The change of service field is optional and may be omitted if partial records are created whenever the basic service is changed.

The coding of basic services is defined in detail in TS 29.002 [05].

In the case of the transit record the GSM basic service employed is generally not available. However, if the device on which the call originates/terminates is connected via ISDN digital subscriber signalling then the appropriate ISDN basic service code may be recorded in the record. One possible example includes the direct connection of an ISDN PABX to an MSC/VLR.

## 5.4 Call duration

This field contains the relevant call duration in seconds. For incomplete calls (call attempts) the relevant duration is the call holding time from the seizure to the release of the traffic channel. For complete (answered) calls this is the chargeable duration from answer to release of the traffic channel. For partial records this is the duration of the individual partial record and not the cumulative duration of the call.

It should be noted that the time stamps may be expressed in terms of tenths of seconds or even milliseconds and, as a result, the calculation of the call duration may result in the rounding or truncation of the measured duration to a whole number of seconds.

Whether or not rounding or truncation is to be used is considered to be outside the scope of the present document subject to the following restrictions:

- 1) A call duration of zero seconds shall not be accepted.
- 2) The same method of truncation/rounding shall be applied to both single and partial records.

If CAMEL is invoked for the call and a control relationship is existing, the call might continue after a RELEASE or a DISCONNECT from the called party side received by the gsmSSF. The call duration of the incoming leg is stored in the main body of the call record. For each outgoing leg the call duration is stored in the respective 'CAMELInformation' module. If a call leg does not reach answer status and attempt charging is enabled a 'CAMELInformation' module containing the holding time is generated.

An example of how to use the call duration and the timestamps is given in Figure 2. It shows a CAMEL controlled mobile originated follow-on scenario. The uppermost arrow ① marks the over all duration of the call that is to be measured and stored in the main body of the respective MOC record. The duration before  $t_5$  (incoming leg) or  $t_4$  (outgoing leg) needs not to be stored since the call is answered later on. The call duration in the first outgoing leg module contains the time interval from  $t_4$  to  $t_6$  (period ②). The call duration measurement of the second outleg is started with  $t_9$  and ended with  $t_{10}$  (interval ③).

Since the last outgoing leg is not answered, the respective module contains the holding time starting with  $t_{11}$  and ending with  $t_{13}$  (period ④).

(The timestamps  $t_1$ ,  $t_2$ ,  $t_3$ ,  $t_7$ ,  $t_8$  and  $t_{12}$  are mentioned for completion reasons only.)

call duration of incoming leg = ←---→

call duration of outgoing leg = ←---→

holding time of outgoing leg = ←---→

Point in time	Signalling message sent/received trigger detection point encountered	Duration logging
t <sub>1</sub>	SETUP; TDP(control)	
t <sub>2</sub>	IAM	seizure of outg. leg 1
t <sub>3</sub>	ACM	
t <sub>4</sub>	ANSWER	start of call duration (outg. leg 1)
t <sub>5</sub>	CONNECT	start of call duration (inc. leg)
t <sub>6</sub>	RELEASE; EDP(control)	stop of call duration (outg. leg 1)
t <sub>7</sub>	IAM	seizure of outg. leg 2
t <sub>8</sub>	ACM	
t <sub>9</sub>	ANSWER	start of call duration (outg. leg 2)
t <sub>10</sub>	RELEASE; EDP(control)	stop of call duration (outg. leg 2)
t <sub>11</sub>	IAM	seizure of outg. leg 3 start of holding time (outg. leg 3)
t <sub>12</sub>	ACM	
t <sub>13</sub>	RELEASE; EDP(control)	stop of holding time (outg. leg 3)

Figure 2: Call duration measurement in follow-on scenarios

## 5.5 Call reference

This field uniquely identifies a call or transaction on one side of the interface (i.e. 'A' or 'B' side) and is derived from the transaction identifier of TS 24.008 [04]. It is also used to identify all partial records and transactions belonging to the same connection.

For the avoidance of doubt, there is **no** global call reference defined within GSM and the call reference field **cannot** be used to combine, for example, the MOC and MTC records of a mobile-to-mobile connection.

## 5.6 Calling / called / connected / translated number

In general a CCITT E.164 [12] number but may also include other numbering plans e.g. X.121. Each of these fields includes the type of number and number plan as specified in detail in TS 24.008 [04]. Where appropriate, these fields may also contain the presentation and screening information also specified in TS 24.008 [04].

The called number is the number received from the mobile station on mobile originated call set-up as defined in TS 24.008 [04]. Similarly, the calling number is the number received from the network on mobile terminated call set-up. In case of CAMEL initiated call forward (CF), the called (forwarded-to) number is returned by CAMEL.

The translated number is the result of any digit translation performed by the MSC on the called number received from the mobile station on mobile originated call set-up. This parameter is not included in the CDR if no digit translation has taken place.

The connected number is the number of the actual party reached as defined in TS 24.008 [04]. Although this is normally identical to the called number it may differ. This parameter is not included if identical to the called number.

The following examples are intended to explain the use of these fields:

- Example 1:      Called Number = Connected Number  
Normal call from a mobile subscriber to a mobile subscriber or to a PSTN subscriber.
- Example 2:      Called Number != Connected Number  
In case of routing to a PABX with Automatic Call Distribution or to an ISDN Basic Access with several devices attached. The connected number is that of the party actually reached. N.B. The recording of the actual number connected may be limited by the capability of intermediate signalling connections.
- Example 3:      MTC for Call Forwarding ("A" -> "B" -> "C")  
In case of call forwarding, the connected number recorded in the MTC record of the "B" subscriber is that of the forwarded-to party or "C" subscriber. The calling party field contains the number of the "A" subscriber.
- Example 4:      Translated Number  
This field is only present if digit translation is applied by the MSC to the called number received from the mobile station. Examples include abbreviated dialling codes and service numbers.

## 5.7 Calling Party Number

This field contains Calling Party Number modified by CAMEL service.

## 5.8 CAMEL call leg information

This field contains a set of CAMEL information IEs according to the number of outgoing CAMEL call legs.

## 5.9 CAMEL information

This field contains a list of parameters with information related to one CAMEL outgoing call leg. This parameter list is an information element (IE) used in the CAMEL Call Leg Information field.

As a network option, parameters that are identical to the corresponding values in the top level structure of the record are not recorded again. That means whenever a value is not mentioned in this set the value provided in the basic record is valid instead. This might lead to an empty or even absent structure, if no parameter was modified.

## 5.10 CAMEL initiated CF indicator

The purpose of this field is to distinguish CAMEL call forwarding service scenarios from standard GSM call forwarding scenarios.

From the Basic Call State Model (BCSM)'s point of view this field is set to 'CF' whenever the Originating CAMEL Subscription Information (O\_CSI) was applied after terminating CAMEL call processing had been taken place changing the call destination. For the avoidance of doubt: this flag does not depend on other modified call parameter(s) (e.g.: redirection information, etc.) received in the CAP\_CONNECT message of the Terminating CAMEL Subscription Information (T\_CSI) service.

This flag also indicates that another record might be generated, one containing the charging information related to the terminating CAMEL service and one containing the charging information related to the originating CAMEL service.

## 5.11 CAMEL modified Service Centre

This field contains SMS-C address modified by CAMEL service. If this field is present the field Service Centre contain SMS-C address before CAMEL modification.

## 5.12 CAMEL SMS Information

This field contains following CAMEL information for mobile originated SMS:

- Default SMS handling  
This field indicates whether or not a CAMEL encounters default SMS handling. This field shall be present only if default SMS handling has been applied.
- Free format data  
See subclause 5. 22.
- Calling Party Number  
This field contains Calling Party Number modified by CAMEL service.
- CAMEL modified Service Centre  
This field contains SMS-C address modified by CAMEL service.
- CAMEL Destination Subscriber Number  
This field contains short message Destination Number modified by CAMEL service.

## 5.13 Cause for termination

This field contains a generalised reason for the release of the connection including the following:

- normal release;
- CAMEL initiated call release;
- partial record generation;
- partial record call re-establishment;
- unsuccessful call attempt;
- abnormal termination during the stable phase.

A more detailed reason may be found in the diagnostics field.

## 5.14 Channel Coding Accepted/Channel Coding Used

A list of traffic channel codings for HSCSD connections accepted/negotiated by the MS.

These parameters are only present in the CDRs for HSCSD connections.

## 5.15 Data volume

This field includes the number of 64 octet segments transmitted during the use of data services if known (see B.1.3 Packet Data Services).

## 5.16 Default call/SMS handling

This field indicates whether or not a CAMEL encountered default call/SMS handling. This field shall be present only if default call/SMS handling has been applied. Parameter is defined in HLR as part of CAMEL subscription information.

## 5.17 Destination Subscriber Number

This field contains Destination/Called Subscriber Number modified by CAMEL service. If not modified then this field may contain original Destination Number also when CAMEL is not active.

## 5.18 Diagnostics

This field includes a more detailed technical reason for the release of the connection and may contain one of the following:

- a MAP error from TS 29.002 [05];
- a Cause from TS 24.008 [04];
- a Cause from TS 29.078 [13];
- a Cause from ISUP Q.767 [14].

The diagnostics may also be extended to include manufacturer and network specific information.

## 5.19 Entity number

This field contains the ITU-T E.164 [12] number assigned to the entity (MSC, VLR, HLR etc.) that produced the record. For further details concerning the structure of MSC and location register numbers see 3GPP TS 23.003 [2].

## 5.20 Equipment id

This field contains a local identifier used to distinguish between equipment of the same equipment type e.g. the number of the conference circuit employed if more than one is available.

## 5.21 Equipment type

This field contains the type of common equipment employed e.g. conference circuit for multi-party service.

## 5.22 Event time stamps

These fields contain the event time stamps relevant for each of the individual record types.

The call records may contain three significant call handling time stamps:

- The time at which the resource in question was seized (Seizure time)
- The time at which the call was answered or at which charging commences. (Answer time)
- The time at which the resource was released (Release time)

For both Mobile Originated and Mobile Terminated calls, the Seizure time is the time at which the traffic channel is allocated i.e. the time at which the ASSIGN COMMAND message is sent to the MS.

For Mobile Originated calls the Answer time is the time at which the CONNECT message is sent to the calling party. For Mobile Terminated calls the time at which the CONNECT message is received from the called party. However, if the subscriber has subscribed to the advice of charge charging level service, then the answer time shall be derived from the time at which the FACILITY message is received from the MS containing the acknowledgement of receipt of the AOC parameters. Similarly, if the AOC parameters are changed during the call then the change time recorded for a subscriber with AOC charging level is the receipt of the FACILITY message from the MS. For a subscriber with AOC information level the change time recorded is the time at which the FACILITY is sent to the MS. Finally, in case of call re-establishment the answer time is the time at which the new traffic channel is allocated by the MSC i.e. when the ASSIGN COMMAND is sent to the MS.

The Release time is the time at which the connection is released by either party i.e. a DISCONNECT or RELEASE is sent by the network or a DISCONNECT is received from the MS. In the case of a radio link failure, the release time is the time at which the failure was detected by the MSC.

For unsuccessful call attempts the Seizure time is mandatory. The Release time is optional and the call duration recorded is the call holding time i.e. the difference between the two.

For successful calls the Answer time is mandatory and both the Seizure and Release times are optional. The call duration recorded is the chargeable duration i.e. the difference between the Answer and Release time stamps.

The event records include the following time stamps:

- HLR-int time: The receipt of a MAP\_SEND\_ROUTING\_INFO request by the HLR.
- Loc.Upd. time: The receipt of a MAP\_UPDATE\_LOCATION\_AREA request by the VLR or the receipt of a MAP\_UPDATE\_LOCATION request by the HLR.
- SS-Action: The receipt of a supplementary service request by the VLR.  
e.g. MAP\_REGISTER\_SS, MAP\_INVOKE\_SS
- SMS-MO: The receipt of an RP\_DATA message from the MS containing an SMS\_SUBMIT PDU.
- SMS-MT: The transmission of an RP\_DATA message to the MS containing an SMS\_DELIVER PDU.

It should be noted that the events listed above are only examples in order to demonstrate the principles and that the list is by no means exhaustive.

All time-stamps include a minimum of date, hour, minute and second.

## 5.23 Fixed Network User Rate

This field indicates the user data rate applied for the connection in the fixed network. In UMTS, it shall be present for all bearer services as specified in TS 22.002. In GSM, this parameter is part of the HSCSD connection parameters, see subclause 5.27.

## 5.24 Free format data

This field contains charging information sent by the gsmSCF in the Furnish Charging Information (FCI) messages as defined in TS 29.078 [13]. The data can be sent either in one FCI message or several FCI messages with append indicator. This data is transferred transparently in the CAMEL sections of the relevant call records. 'Free format data' sent to the legID=1 is always stored in the top level of the respective record. 'Free format data' sent to the legID >1 is stored in the appropriate CAMEL call leg information field.

If the FCI is received more than once during one continuing incoming/outgoing CAMEL call leg, the append indicator defines whether the FCI information is appended to previous FCI and stored in the relevant record or the information of the last FCI received is stored in the relevant record (the previous FCI information shall be overwritten).

In the event of partial output the currently valid 'Free format data' is stored in the partial record.

## 5.25 Free format data append indicator

This field contains an indicator whether free format data is to be appended to free format data stored in previous partial CDR. This field is needed in CDR postprocessing to sort out valid free format data for that call leg from sequence of partial records. Creation of partial records is independent on received FCIs and thus valid free format data may be divided to different partial records.

If field is missing then free format data in this CDR replaces all received free format data in previous CDRs. Append indicator is not needed in the first partial record. In following partial records indicator shall get value true if all FCIs received during that partial record have append indicator. If one or more of the received FCIs for that call leg during the partial record do not have append indicator then this field shall be missing.

## 5.26 GsmSCF address

This field identifies the CAMEL server serving the subscriber. Address is defined in HLR as part of CAMEL subscription information.

## 5.27 HSCSD parameters / Change of HSCSD parameters

The basic HSCSD parameters are negotiated between the MS and the network at call setup time. They comprise of the following parameters:

- the FNUR (Fixed Network User Rate) (optionally)
- the total AIUR (Air Interface User Rate) requested by the MS (for non-transparent HSCSD connections only)
- a list of the channel codings accepted by the MS
- the maximum number of traffic channels accepted by the MS (this is noted in the channels requested field)
- the channel coding and the number of traffic channels actually used for the call.

In case the network or user initiated modification procedure takes place during the call, the AIUR requested, the channel coding used and the number of traffic channel requested/used might be recorded in the Change of HSCSD parameters field including the time at which the change occurred and which entity requested the change.

It should be noted that the Change of HSCSD Parameters field is optional and not required if partial records are generated when a Change of HSCSD Parameters takes place.

## 5.28 Incoming/ outgoing trunk group

The incoming trunk group describes the trunk on which the call originates as seen from the MSC. For mobile originated calls this will generally be a BSS trunk. Similarly, the outgoing trunk group describes the trunk on which the call leaves the MSC.

For 3G, this parameter may not be available. When available, this parameter shall be supplied in the CDRs.

## 5.29 Interrogation result

This field contains the result of the HLR interrogation attempt as defined in the MAP (TS 29.002 [05]).

NOTE: This field is only provided if the attempted interrogation was unsuccessful.

## 5.30 IMEI Check Event

This field identifies the type of event that caused the IMEI check to take place:

- Mobile originating call attempt;
- Mobile terminating call attempt;
- Mobile originating SMS;
- Mobile terminating SMS;
- Supplementary service actions performed by the subscriber;
- Location update

## 5.31 IMEI Status

This field contains the result of the IMEI checking procedure:

- Greylisted;
- Blacklisted;
- Non-whitelisted.

## 5.32 Level of CAMEL service

This field describes briefly the complexity of CAMEL invocation.

- 'Basic' means that CAMEL feature is invoked during the setup phase (e.g.: to modify the destination) of the call only.
- 'Online charging' means that CAMEL supported AoC parameter were sent to the mobile station (the Send Charging Information message, SCI, is received from the gsmSCF).
- The flag 'call duration supervision' is set whenever the call duration supervision is applied in the gsmSSF of the VPLMN (apply charging message is received from the gsmSCF).

### 5.33 Location / change of location

The location field contains a combination of the location area code (LAC) and cell identity (CI) of the cell in which the served party is currently located. Any change of location may be recorded in the change of location field including the time at which the change took place.

The change of location field is optional and not required if partial records are generated when the location changes.

The LAC and CI are both 2 octet quantities and coded according to TS 24.008 [04].

### 5.34 Message reference

This field contains a unique message reference number allocated by the mobile station when transmitting a short message to the service centre. This field corresponds to the TP-Message-Reference element of the SMS\_SUBMIT PDU defined in TS 23.040 [15].

### 5.35 Mobile station classmark / change of classmark

This MS classmark field contains the mobile station classmark employed by the served MS on call set-up as defined in TS 24.008 [04] (see mobile station classmark 2). Any alteration in the classmark during the connection may be recorded in the change of classmark field and will include the time at which the change took place.

It should be noted that the change of classmark field is optional and not required if partial records are created when the classmark is altered.

### 5.36 MSC Address

This field contains the ITU-T E.164 [12] number assigned to the MSC that produced the record. For further details concerning the structure of MSC numbers see 3GPP TS 23.003 [2].

### 5.37 MSC Server Indication

This field contains an indicator whether the CAMEL subscription information is active. The parameter is present for the VT-C SI in the VMSC and not present for the T-C SI in the GMSC.

This indication should be used for differentiation between the validity of the record content for T-C SI in the GMSC and VT-C SI in the VMSC.

### 5.38 Network Call Reference

Whenever CAMEL is applied, this field is used for correlation of call records outputted from the originating MSC (when applicable), the GMSC and the terminating MSC, and a network optional call record from the gsmSCF.

### 5.39 Number of DP encountered

This field indicates how often CAMEL armed detection points (TDP and EDP) were encountered and is a measure of signalling between serving network and CAMEL service and complements 'Level of CAMEL service' field. Detection

points from all applied CAMEL services for a single call leg and processed in the same gsmSSF shall be counted together.

## 5.40 Number of forwarding

This field, if provided via ISUP signalling, contains the number of times a call has been forwarded prior to the interrogation of the HLR and is defined in TS 29.002 [05].

## 5.41 Old /new location

These fields contain the location of a mobile subscriber before and after a location update. In case of VLR location update the location information consists of a VMSC number and location area code. In case of HLR location update the field contains the VMSC number and the VLR number.

## 5.42 Radio channel requested / radio channel used / change of radio channel

The radio channel requested field contains the type of channel requested by the user. The following values are permitted:

- full rate;
- half rate;
- dual mode half rate preferred;
- dual mode full rate preferred.

The radio channel used field indicates the type of traffic channel actually employed for the connection i.e. either full rate (Bm) or half rate (Lm) as described in GSM 05.01. Any change in the type of channel used may be recorded in the change of radio channel used field including the time at which the change occurred and the speech version used after the change of radio channel.

## 5.43 Rate Indication

This parameter specifies the rate adaptation that was used for the connection. The field is constructed from the information in the parameters "rate adaption" and "other rate adaption" signalled between the MS/UE and the network, see TS 24.008.

The format of this field is a single octet with the following format:

- Bits 0-1: the Rate Adaption field as defined in TS 24.008
- Bits 2-3: the Other Rate Adaption field as defined in TS 24.008
- Bits 4-7: not used

## 5.44 Record extensions

The field enables network operators and/ or manufacturers to add their own extensions to the standard record definitions.

## 5.45 Record type

The field identifies the type of the record e.g. mobile originated, mobile terminated etc.

## 5.46 Recording Entity

This field contains the ITU-T E.164 [12] number assigned to the entity (MSC, VLR, HLR etc.) that produced the record. For further details concerning the structure of MSC and location register numbers see 3GPP TS 23.003 [2].

## 5.47 Roaming number

The roaming number field of the MOC record contains the mobile station roaming number as defined in TS 23.003 [16] and coded according to TS 29.002 [05].

## 5.48 Routing number

The routing number field of the HLR interrogation record contains either a mobile station roaming number or, in case of call forwarding, a forwarded-to number.

## 5.49 Sequence number

This field contains a running sequence number employed to link the partial records generated for a particular connection (see 7.2.4 Partial records).

## 5.50 Served IMEI

This fields contains the international mobile equipment identity (IMEI) of the equipment served. The term "served" equipment is used to describe the ME involved in the transaction recorded e.g. the called ME in case of an MTC record.

The structure of the IMEI is defined in TS 23.003 [16].

## 5.51 Served IMSI

This fields contains the international mobile subscriber identity (IMSI) of the served party. The term "served" party is used to describe the mobile subscriber involved in the transaction recorded e.g. the calling subscriber in case of an MOC record.

The structure of the IMSI is defined in TS 23.003 [16].

## 5.52 Served MSISDN

This fields contains the mobile station ISDN number (MSISDN) of the served party. The term "served" party is used to describe the mobile subscriber involved in the transaction recorded e.g. the called subscriber in case of an MTC record. In case of multi-numbering the MSISDN stored in a MOC record will be the primary MSISDN of the calling party.

The structure of the MSISDN is defined in TS 23.003 [16].

## 5.53 Service centre address

This field contains a CCITT E.164 [12] number identifying a particular service centre e.g. short message service centre (see TS 23.040 [15]).

## 5.54 Service key

This field identifies the CAMEL service logic applied. Service key is defined in HLR as part of CAMEL subscription information.

## 5.55 Short message service result

This field contains the result of an attempt to deliver a short message either to a service centre or to a mobile subscriber (see TS 29.002 [05]). Note that this field is only provided if the attempted delivery was unsuccessful.

## 5.56 Speech version supported / Speech version used

The speech version supported field contains the speech version supported by the MS with the highest priority. The speech version used field contains the speech codec version assigned for that call. The coding is according GSM 08.08 speech version identifier with the extension bit 8 set to 0.

It should be noted that the change of radio channel field is optional and not required if partial records are generated.

## 5.57 System type

This field indicates the use of GERAN, UTRAN (or a value of unknown). This field is present when either the UTRAN or GERAN air-interface is used on call setup. For an open CDR in a 2G NE (responsible for the CDR), the field is not present (even if the call is handed off to a 3G air interface). For a CDR in a 3G NE (responsible for the CDR), the value unknown shall be used after handover.

## 5.58 Supplementary service(s)

The supplementary service field in the Supplementary Service record type contains the code of the supplementary service on which the action was performed.

The supplementary services field in the MOC / MTC records contains the codes of the supplementary services invoked as a result of, or during, a connection.

The coding of supplementary service is described in detail in TS 29.002 [05].

## 5.59 Supplementary service action

This field contains the type of supplementary service action requested by the subscriber or performed by the network. Possible values include:

- registration;
- erasure;
- activation;
- deactivation;
- interrogation;
- invocation.

For further details see TS 22.004 [19].

## 5.60 Supplementary service action result

This field contains the result of an attempted supplementary service action (see TS 29.002 [05]). Note that this field is only provided if the SS-action was at least partially unsuccessful.

## 5.61 Supplementary service parameters

This field contains the parameters associated with a supplementary service action requested by the subscriber. For further details of the parameters involved see the GSM 02.8n series of documents.

## 5.62 Supplementary service(s)

The supplementary service field in the Supplementary Service record type contains the code of the supplementary service on which the action was performed.

The supplementary services field in the MOC / MTC records contains the codes of the supplementary services invoked as a result of, or during, a connection.

The coding of supplementary service is described in detail in 3GPP TS 29.002 [5].

## 5.63 Transparency indicator

This field indicates whether the basic service was employed in transparent or non-transparent mode. It should also be noted that this field is only relevant for those services which may be operated in both transparent and non-transparent modes.

## 5.64 Update result

This field contains the result of the location update request as defined in the MAP (TS 29.002 [05]). Note that this field is only provided if the attempted update was unsuccessful.

---

# 6 Charging Data Record Structure

## 6.1 ASN.1 definitions for CDR information

Within the current 3GPP TS 32-series of specifications the ASN.1 definitions are based on X.208 [08] which has been superseded by X.680. This newer version not only includes new features but also removes some that were present in X.208. It was agreed that where possible, the GPRS work would be based on those ASN.1 features that were common to both. However, where necessary, the new features in X.680 [07] be used in some places. X.208 [08] feature that are no longer in X.680 [07] will not be used.

## 7. Charging Data Record Transfer

### 7.1 Bulk Data Transfer

The charging data records shall be transferred from the NEF to the OSF by the use of FTAM protocol on X.25 or TCP/IP, FTP over TCP/IP, or TFTP over TCP/IP services. For further details of the use of FTAM see GSM 12.01 [25], for the use of FTP see [26], and for the use of TFTP see [27].

# Foreword

This Technical Specification (TS) has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

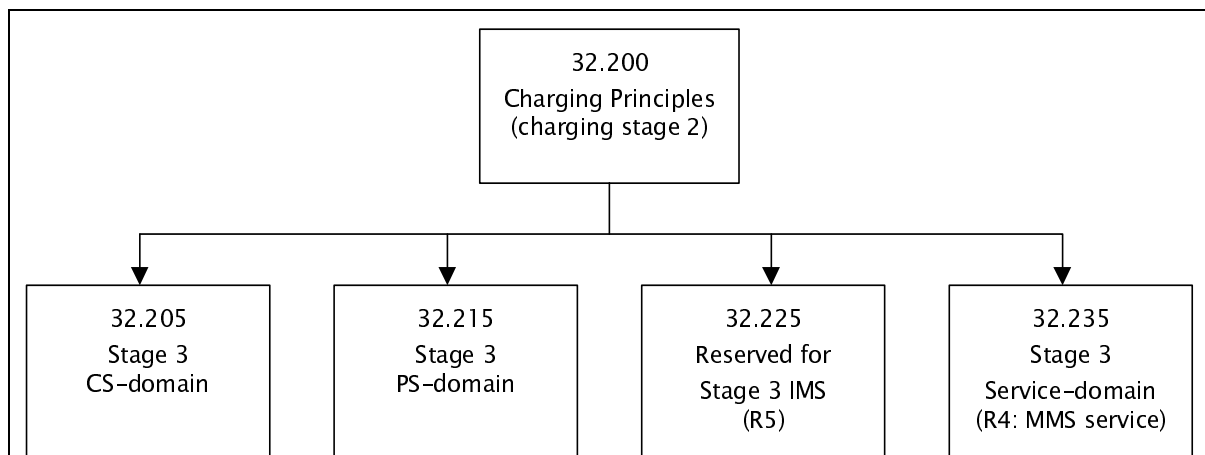

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

---

# 1. Scope

The GSM and UMTS PLMN support a wide range of packet based services by means of the General Packet Radio Service (GPRS), as defined in 3GPP TS 22.060 [1] and 3GPP TS 23.060 [2]. In order to enable operators the ability to provide a commercially viable service, there is a need to provide charging functions. For GPRS these functions include the generation of Charging Data Records (CDRs) by the Serving GPRS Support Node (SGSN) and the Gateway GPRS Support Node (GGSN) as well as the transport of these CDRs to a Billing System (BS) through a Charging Gateway Function (CGF).

This document is part of a series of documents specifying charging functionality in UMTS networks. The UMTS charging architecture and principles are specified in document TS 32.200 [3] which provides an umbrella for other charging documents that specify the structure and content of the CDRs and the interface protocol that is used to transfer them to the collecting node.. The CDRs content and transport within the PS domain are described in the present document. The CDRs used in the Circuit Switched (CS) domain are specified in document TS 32.205 [4] while CDRs used for application services are defined in document TS 32.235 [5]. This document structure is depicted in Figure 1.

**Figure 1: Charging Documents Structure**

All references, abbreviations, definitions, descriptions, principles and requirements that are common to charging in UMTS domains or subsystems are provided in the umbrella document [3]. To avoid unnecessary duplications, they are not repeated in the present document unless it is essential.

---

# 2. References

The following documents contain provisions, which through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.

## 3. Definitions, abbreviations and symbols

### 3.1 Definitions

For the purposes of the present document the following definitions apply. Additional applicable definitions for charging principles in UMTS are provided in TS 32.200 [3]. Other general definitions can be found in 3GPP TS 22.060 [1].

**domain:** Part of a communication network that provides services using a certain technology.

**Packet Switched domain:** A domain within UMTS and GSM in which data is transferred in packet mode.

**2G- / 3G- :** The terms 2G and 3G, and the prefixes 2G- and 3G- refer to functionality that supports only GSM or UMTS, respectively, e.g. 2G-SGSN refers only to the GSM functionality of an SGSN. When the term/prefix is omitted, reference is made independently from the GSM or UMTS functionality.

**CDR (Charging Data Record):** A record generated by a network element for the purpose of billing a subscriber for the provided service. It includes fields identifying the user, the session and the network elements as well as information on the network resources and services used to support a subscriber session. In the traditional circuit domain, CDR has been used to denote “Call Detail Record”, which is subsumed by “Charging Data Record” hereafter.

**CDR field Categories:** The CDR fields are defined in this document. They are divided into the following categories:

**Mandatory** – A field that shall be present in the CDR.

**Conditional** – A field that shall be present in a CDR if certain conditions are met.

**Operator Provisionable: Mandatory** – A field that operators have provisioned to be included in the CDR for all conditions.

**Operator Provisionable: Conditional** - A field that operators have provisioned to be included in the CDR if certain conditions are met.

**Partial CDR:** A CDR that provides information on part of a subscriber session. A long session may be covered by several partial CDRs. Two formats are considered for Partial CDRs. One that contains all of the necessary fields; the second has a reduced format.

**Fully qualified Partial CDR (FQPC):** A partial CDR that contains a complete set of the fields specified in this document. This includes all the mandatory and conditional fields as well as those fields that the PLMN operator has provisioned to be included in the CDR. The first Partial CDR shall be a Fully qualified Partial CDR.

**Reduced Partial CDR (RPC):** Partial CDRs that only provide mandatory fields and information regarding changes in the session parameters relative to the previous CDR. For example, location information is not repeated in these CDRs if the subscriber did not change its location.

## 3.2 Abbreviations

For the purposes of the present document the following abbreviations apply. Additional applicable abbreviations can be found in 3GPP TS 21.905 [6].

APN	Access Point Name
BMD	Billing Mediation Device
BS	Billing System
CAMEL	Customised Applications for Mobile network Enhanced Logic
CDR	Charging Data Record (replaces the previous definition of Call Detail Record)
CG	Charging Gateway
CGF	Charging Gateway Function
CI	Cell Identity
CS	Circuit Switched
CSE	CAMEL Service Environment
DRP	Data Record Packet
EM	Element Management
FCI	Furnish Charging Information
FQPC	Fully qualified Partial CDR
G-CDR	GGSN generated– CDR
GGSN	Gateway GPRS Support Node
GPRS	General Packet Radio Service
GSN	GPRS Support Node (either SGSN or GGSN)
GTP	GPRS Tunnelling Protocol
IE	Information Element
IHOSS:OSP	Internet Hosted Octet Stream Service: Octet Stream Protocol
IMEI	International Mobile Equipment Identity
IMSI	International Mobile Subscriber Identity
IP	Internet Protocol
IPv4	Internet Protocol version 4
IPv6	Internet Protocol version 6

LAC	Location Area Code
M-CDR	Mobility Management generated-Charging Data Record
MCC	Mobile Country Code (part of IMSI)
ME	Mobile Equipment
MNC	Mobile Network Code (part of IMSI)
MS	Mobile Station
MSISDN	Mobile Station ISDN number
NE	Network Element
NI	Network Identifier (part of the APN)
OI	Operator Identifier (part of the APN)
PDP	Packet Data Protocol, e.g. IP
PDU	Packet Data Unit
PLMN	Public Land Mobile Network
PPP	Point-to-Point Protocol
PS	Packet Switched
PT	Protocol Type (Field in GTP' header)
RAB	Radio Access Bearer
RAC	Routing Area Code
RPC	Reduced Partial CDR
S-CDR	SGSN (PDP context) generated – CDR
SAC	Service Area Code
SGSN	Serving GPRS Support Node
S-SMO-CDR	SGSN delivered Short message Mobile Originated – CDR
S-SMT-CDR	SGSN delivered Short message Mobile Terminated – CDR
TID	Tunnel Identifier
TLV	Type, Length, Value (GTP header format)
TV	Type, Value
UMTS	Universal Mobile Telecommunications System
URA	UTRAN Registration Area
USIM	Universal Subscriber Identity Module
UTRAN	UMTS Terrestrial Radio Access Network

### 3.3 Symbols

For the purposes of the present document the following symbols apply:

Ga	Charging data collection interface between a CDR transmitting unit (e.g. GGSN or SGSN) and a CDR receiving unit (CGF).
GTP'	The GPRS protocol used for CDR transport. It is derived from GTP with enhancements to improve transport reliability necessary for CDRs. (Note that this protocol is not used for tunnelling.)

---

## 4. Record types and contents

### 4.1 CDR Fields

Five types of CDRs can be generated in the PS domain by the GSNs. As described in document 32.200 [3], the types that can be generated by the SGSN are: S-CDR, M-CDR, S-SMO-CDR and S-SMT-CDR. The GGSN generates a G-CDR. The content of each CDR type is defined in one of the five tables that are part of this section. For each CDR type the field definition includes the field name, description and category.

Equipment vendors shall be able to provide all of the fields listed in the CDR content table in order to claim compliance with this document. However, since CDR processing and transport consume network resources, operators may opt to eliminate some of the fields that are not essential for their operation. This operator provisionable reduction is specified by the field category.

A field category can have one of two primary values:

**M** This field is **Mandatory** and shall always be present in the CDR.

**C** This field shall be present in the CDR only when certain **Conditions** are met. These **Conditions** are specified as part of the field definition. .

All other fields are designated as **Operator (O)** provisionable, which replaced the “Optional” category, specified in earlier releases. Using network management functions or specific tools provided by an equipment vendor, operators may choose if they wish to include or omit the field from the CDR. Once omitted, this field is not generated in a CDR. To avoid any potential ambiguity, a CDR generating element **MUST** be able to provide all these fields. Only an operator can choose whether or not these fields should be generated in their system.

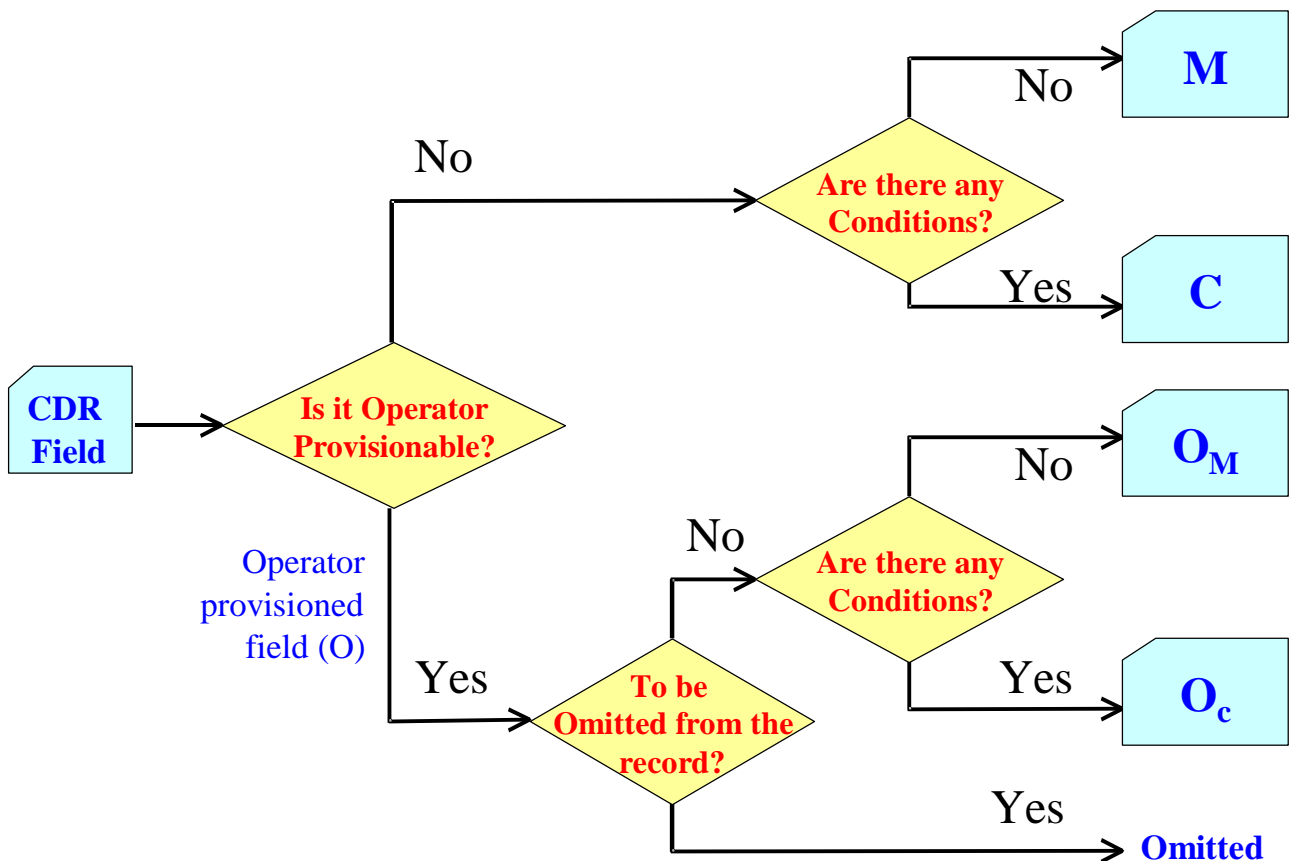

Those fields that the operator wishes to be present are further divided into a mandatory and conditional categories:

**O<sub>M</sub>** This is a field that, if provisioned by the operator to be present, shall always be included in the CDRs. In other words, an **O<sub>M</sub>** parameter that is provisioned to be present is a mandatory parameter.

**O<sub>C</sub>** This is a field that, if provisioned by the operator to be present, shall be included in the CDRs when the required conditions are met. In other words, an **O<sub>C</sub>** parameter that is configured to be present is a conditional parameter.

A logical diagram showing the possible field categories is shown in Figure 2.

The content of the CDRs shall be specified on all the open network interfaces that are used for CDR transport. They include the GSN - CGF interface and the outward interface from the core network to the billing system. The rules governing the CDR specifications on these interfaces are summarised in the following subclause.

**Figure 2: Logical Diagram illustrating the different CDR Field Categories**

### 4.1.1 CDR Fields on the GSN/CGF (Ga) interface

The tables in the subsequent parts of section 4 specify the Mandatory (M), Conditional (C) and Operator optional ( $O_M$  or  $O_C$ ) designations at the GSN / CGF interface (i.e., the  $G_a$  interface). A CDR containing all Mandatory, Conditional and those optional fields provisioned by the operator ( $O_M$  and  $O_C$ ) are considered to be a *Fully Qualified CDR*. The size of the CDRs could be optionally reduced by allowing a reduced format for *Partial CDRs* (see definitions in Section 3.1). During a long user session several *Partial CDRs* may be generated for the same session. In this case, some information can be eliminated rather than repeated in all the partial CDRs for that session. Only changes from one CDR to the next, in addition to mandatory information, can be reported. All the missing information can be reconstructed from fields in previous partial CDRs for the session. For example, if a subscriber did not change location, the Reduced Partial CDR would not include any location information.

Therefore, two formats are considered for Partial CDRs:

- a *Fully Qualified Partial CDR* that contains the Complete CDR Fields, and
- a *Reduced Partial CDR* that contains all the Mandatory fields (**M**) and ONLY the changes that occurred in any other field relative to the previous Partial CDR.

The first CDR generated when a session is opened shall be a Fully qualified Partial CDR. Subsequent partial CDRs may be *Reduced Partial CDRs*.

Thus, the convention is that when any non-mandatory field is missing from a Reduced Partial CDR, it should be interpreted that the same field as in the previous partial CDR could be used. Only Mandatory (**M**) and changed fields MUST always be included.

The GSNs and the CGF from all vendors that comply with this standard shall always be able to generate or receive Fully Qualified Partial CDRs. Generation and reception of Reduced Partial CDRs on the  $G_a$  interface is optional. However, if Reduced Partial CDRs are transmitted on the  $G_a$  interface they must comply with the rules specified in this clause.

### 4.1.2 CDR Fields on the Core Network-Billing System Interface

The CGF must be able to provide complete CDRs at the CGF / Billing System (BS) interface in the format and encoding described in the present document. Additional CDR formats and contents, generated by the CGF, may be available at this interface to meet the BS requirements.

If the GSNs are generating Reduced Partial CDRs on the  $G_a$  interface, the CGF must be able to convert the CDRs into Fully qualified Partial CDRs. However, if the BS can support Reduced Partial CDRs, no conversion to the fully-qualified partial CDR format is required.

The possible charging configurations that can be supported on both the  $G_a$  and the outbound interfaces are illustrated in Figure 3. Configuration a) is the default arrangement that MUST be supported by all systems. The other configurations are optional that may be supported IN ADDITION to configuration a). Configuration b) illustrates the case where the CGF is converting Reduced to Fully Qualified Partial CDRs. Configuration c) depicts the case where Reduced Partial CDRs can be received in the billing domain and no conversion is needed.

Equipment vendors shall declare if the GSNs, the CGF and the BS domain support Reduced Partial CDRs based on the above rules. If the CGF can not support Reduced Partial CDRs, then all the GSNs shall be provisioned to generate only fully qualified Partial CDRs (i.e., only configuration a) is possible). On the other hand, if the CGF can convert Partial CDRs format then the GSNs may generate Reduced Partial CDRs based on the rules specified above. In this case configurations b) can also be supported. Reduced Partial CDRs may also be generated by the GSNs if the billing domain can support the reduced format regardless of the CGF features (configuration c).

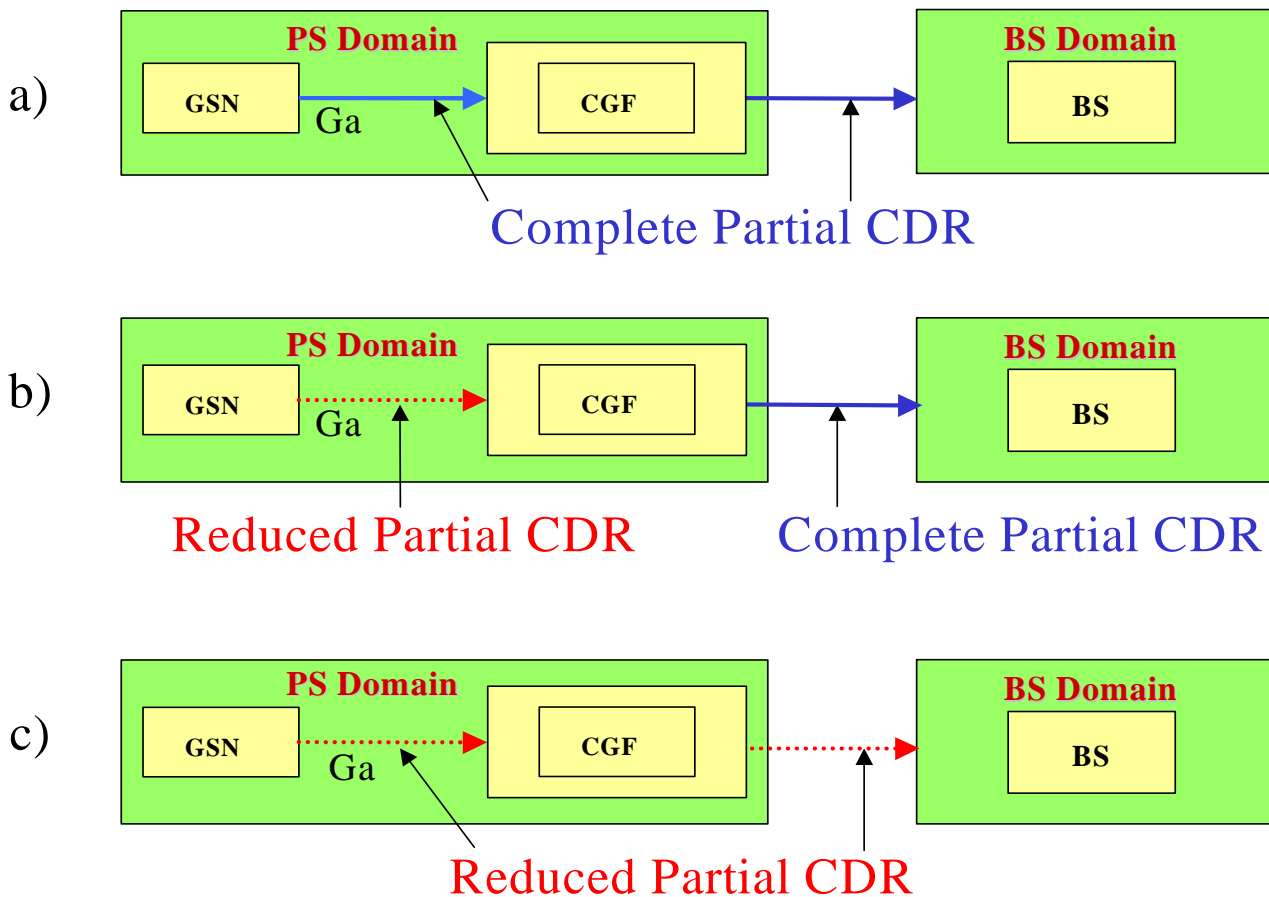

Figure 3: Possible Configurations of CDR Formats that can be supported on the PS domain open interfaces. Configuration a) shall be available in all systems. Other Configurations may be used in addition.

## 4.2 Charging data in SGSN (S-CDR)

If the collection of CDR data is enabled then the SGSN data specified in Table 1 shall be available for each PDP context. The table provides a brief description of each field. A more elaborate definition of the fields, sorted by the field name in alphabetical order, is provided in Section 5.

Table 1: SGSN PDP context data (S-CDR)

Field	Category	Description
Record Type	M	SGSN PDP context record.
Network Initiated PDP Context	O <sub>C</sub>	A flag that is present if this is a network initiated PDP context.
Served IMSI	M	IMSI of the served party
Served IMEI	O <sub>C</sub>	The IMEI of the ME, if available.
SGSN Address	O <sub>M</sub>	The IP address of the current SGSN.
MS Network Capability	O <sub>M</sub>	The mobile station Network Capability.
Routing Area Code (RAC)	O <sub>M</sub>	RAC at the time of "Record Opening Time"
Location Area Code (LAC)	O <sub>M</sub>	LAC at the time of "Record Opening Time"
Cell Identifier	O <sub>M</sub>	Cell identity for GSM or Service Area Code (SAC) for UMTS at the time of "Record Opening Time".
Charging ID	M	PDP context identifier used to identify this PDP context in different records created by GSNs
GGSN Address Used	M	The control plane IP address of the GGSN currently used. The GGSN address is always the same for an activated PDP context.
Access Point Name Network Identifier	O <sub>M</sub>	The logical name of the connected access point to the external packet data network (network identifier part of APN).
PDP Type	O <sub>M</sub>	PDP type, i.e. IP, PPP, IHOSS:OSP

Served PDP Address	O <sub>C</sub>	PDP address of the served IMSI, i.e. IPv4 or IPv6. This parameter shall be present except when both the PDP type is PPP and dynamic PDP address assignment is used.
List of Traffic Data Volumes	O <sub>M</sub>	A list of changes in charging conditions for this PDP context, each change is time stamped. Charging conditions are used to categorise traffic volumes, such as per QoS/tariff period. Initial and subsequently changed QoS and corresponding data volumes are listed.
Record Opening Time	M	Time stamp when PDP context is activated in this SGSN or record opening time on subsequent partial records.
Duration	M	Duration of this record in the SGSN.
SGSN Change	C	Present if this is first record after SGSN change.
Cause for Record Closing	M	The reason for closure of the record from this SGSN.
Diagnostics	O <sub>M</sub>	A more detailed reason for the release of the connection.
Record Sequence Number	C	Partial record sequence number in this SGSN. Only present in case of partial records.
Node ID	O <sub>M</sub>	Name of the recording entity
Record Extensions	O <sub>C</sub>	A set of network operator / manufacturer specific extensions to the record. Conditioned upon the existence of an extension.
Local Record Sequence Number	O <sub>M</sub>	Consecutive record number created by this node. The number is allocated sequentially including all CDR types.
APN Selection Mode	O <sub>M</sub>	An index indicating how the APN was selected.
Access Point Name Operator Identifier	O <sub>M</sub>	The Operator Identifier part of the APN.
Served MSISDN	M	The primary MSISDN of the subscriber.
Charging Characteristics	M	The Charging Characteristics applied to the PDP context.
System Type	O <sub>C</sub>	Indicates the type of air interface used, e.g. UTRAN. This field is present when either the UTRAN or GERAN air-interface is used. It is omitted when the service is provided by a GSM air interface.
CAMEL Information	O <sub>C</sub>	Set of CAMEL information related to PDP context. For more information see Description of Record Fields. This field is present if CAMEL service is activated.
RNC Unsent Downlink Volume	O <sub>C</sub>	The downlink data volume which the RNC has not sent to MS. This field is present when the RNC has provided unsent downlink volume count at RAB release.
Charging Characteristics Selection Mode	O <sub>M</sub>	Holds information about how Charging Characteristics were selected.
Dynamic Address Flag	O <sub>C</sub>	Indicates whether served PDP address is dynamic, which is allocated during PDP context activation. This field is missing if address is static.

## 4.3 Charging data in GGSN (G-CDR)

If the collection of CDR data is enabled then the GGSN data specified in Table 2 shall be available for each PDP context. The table provides a brief description of each field. A more elaborate definition of the fields, sorted by the field name in alphabetical order, is provided in Section 5.

**Table 2: GGSN PDP context data (G-CDR)**

Field	Category	Description
Record Type	M	GGSN PDP context record.
Network initiated PDP context	O <sub>C</sub>	A flag that is present if this is a network initiated PDP context.
Served IMSI	M	IMSI of the served party
GGSN Address used	M	The control plane IP address of the GGSN used.
Charging ID	M	PDP context identifier used to identify this PDP context in different records created by GSNs
SGSN Address	M	List of SGSN addresses used during this record.
Access Point Name Network Identifier	O <sub>M</sub>	The logical name of the connected access point to the external packet data network (network identifier part of APN).
PDP Type	O <sub>M</sub>	PDP type, i.e. IP, PPP, or IHOSS:OSP
Served PDP Address	O <sub>C</sub>	PDP address, i.e. IPv4 or IPv6. This parameter shall be present except when both the PDP type is PPP and dynamic PDP address assignment is used.
Dynamic Address Flag	O <sub>C</sub>	Indicates whether served PDP address is dynamic, which is allocated during PDP context activation. This field is missing if address is static.
List of Traffic Data Volumes	O <sub>M</sub>	A list of changes in charging conditions for this PDP context, each change is time stamped. Charging conditions are used to categorise traffic volumes, such as per tariff period. Initial and subsequently changed QoS and corresponding data values are listed.
Record Opening Time	M	Time stamp when PDP context is activated in this GGSN or record opening time on subsequent partial records.
Duration	M	Duration of this record in the GGSN.
Cause for Record Closing	M	The reason for the release of record from this GGSN.
Diagnostics	O <sub>M</sub>	A more detailed reason for the release of the connection.
Record Sequence Number	C	Partial record sequence number, only present in case of partial records.
Node ID	O <sub>M</sub>	Name of the recording entity.
Record Extensions	O <sub>C</sub>	A set of network operator / manufacturer specific extensions to the record. Conditioned upon the existence of an extension.
Local Record Sequence Number	O <sub>M</sub>	Consecutive record number created by this node. The number is allocated sequentially including all CDR types.
APN Selection Mode	O <sub>M</sub>	An index indicating how the APN was selected.
Served MSISDN	M	The primary MSISDN of the subscriber.
Charging Characteristics	M	The Charging Characteristics applied to the PDP context.
Charging Characteristics Selection Mode	O <sub>M</sub>	Holds information about how Charging Characteristics were selected.

## 4.4 Mobile station mobility management data in SGSN (M-CDR)

If the collection of MS mobility management data is enabled then the SGSN shall start collecting the information specified in Table 3 each time the mobile is attached to the SGSN. The table provides a brief description of each field. A more elaborate definition of the fields, sorted by the field name in alphabetical order, is provided in Section 5.

**Table 3: SGSN Mobile Station mobility management data (M-CDR)**

Field	Category	Description
Record Type	M	SGSN mobility management record.
Served IMSI	M	IMSI of the MS.
Served IMEI	O <sub>C</sub>	The IMEI of the ME, if available.
SGSN Address	O <sub>M</sub>	The IP address of the current SGSN.
MS Network Capability	O <sub>M</sub>	The mobile station network capability.
Routing Area Code	O <sub>M</sub>	Routing Area at the time of the Record Opening Time.
Local Area Code	O <sub>M</sub>	Location Area Code at the time of Record Opening Time.
Cell Identifier	O <sub>M</sub>	The Cell Identity for GSM or Service Area Code (SAC) for UMTS at the time of the Record Opening Time.
Change of Location	O <sub>C</sub>	A list of changes in Routing Area Code, each with a time stamp. This field is not required if partial records are generated when the location changes.
Record Opening Time	M	Timestamp when MS is attached to this SGSN or record opening time on following partial record.
Duration	M	Duration of this record.
SGSN Change	C	Present if this is first record after SGSN change.
Cause for Record Closing	M	The reason for the closure of the record in this SGSN.
Diagnostics	O <sub>M</sub>	A more detailed reason for the release of the connection.
Record Sequence Number	C	Partial record sequence number in this SGSN; only present in case of partial records.
Node ID	O <sub>M</sub>	Name of the recording entity.
Record Extensions	O <sub>C</sub>	A set of network operator / manufacturer specific extensions to the record. Conditioned upon the existence of an extension.
Local Record Sequence Number	O <sub>M</sub>	Consecutive record number created by this node. The number is allocated sequentially including all CDR types.
Served MSISDN	M	The primary MSISDN of the subscriber.
Charging Characteristics	M	The Charging Characteristics used by the SGSN.
CAMEL Information	O <sub>C</sub>	Set of CAMEL information related to Attach/Detach session. For more information see Description of Record Fields. This field is present if CAMEL service is activated.
System Type	O <sub>C</sub>	Indicates the type of air interface used, e.g. UTRAN. This field is present when either the UTRAN or GERAN air-interface is used. It is omitted when the service is provided by a GSM air interface.
Charging Characteristics Selection Mode	O <sub>M</sub>	Holds information about how Charging Characteristics were selected.

## 4.5 SMS-MO data in SGSN (S-SMO-CDR)

If enabled, an S-SMO-CDR SGSN Mobile originated SMS record shall be produced for each short message sent by a mobile subscriber via the SGSN. The fields in the record are specified in Table 4. The table provides a brief description of each field. A more elaborate definition of the fields, sorted by the field name in alphabetical order, is provided in Section 5.

**Table 4: SGSN Mobile originated SMS record (S-SMO-CDR)**

Field	Category	Description
Record Type	M	SGSN Mobile Originated SMS.
Served IMSI	M	The IMSI of the subscriber.
Served IMEI	O <sub>C</sub>	The IMEI of the ME, if available.
Served MSISDN	M	The primary MSISDN of the subscriber.
MS Network Capability	O <sub>M</sub>	The mobile station network capability.
Service Centre	O <sub>M</sub>	The address (E.164) of the SMS-service centre.
Recording Entity	O <sub>M</sub>	The E.164 number of the SGSN.
Location Area Code	O <sub>M</sub>	The Location Area Code from which the message originated.
Routing Area Code	O <sub>M</sub>	The Routing Area Code from which the message originated.
Cell Identifier	O <sub>M</sub>	The Cell Identity for GSM or Service Area Code (SAC) for UMTS from which the message originated.
Message Reference	M	A reference provided by the MS uniquely identifying this message.
Event Time Stamp	M	The time at which the message was received by the SGSN from the subscriber.
SMS Result	C	The result of the attempted delivery if unsuccessful.
Record Extensions	O <sub>C</sub>	A set of network operator/ manufacturer specific extensions to the record. Conditioned upon the existence of an extension.
Node ID	O <sub>M</sub>	Name of the recording entity.
Local Record Sequence Number	O <sub>M</sub>	Consecutive record number created by this node. The number is allocated sequentially including all CDR types.
Charging Characteristics	M	The Charging Characteristics flag set used by the SGSN.
System Type	O <sub>C</sub>	Indicates the type of air interface used, e.g. UTRAN. This field is present when either the UTRAN or GERAN air-interface is used. It is omitted when the service is provided by a GSM air interface.
Destination Number	O <sub>M</sub>	The destination short message subscriber number.
CAMEL Information	O <sub>C</sub>	Set of CAMEL information related to SMS session. For more information see Description of Record Fields. This field is present if CAMEL service is activated.
Charging Characteristics Selection Mode	O <sub>M</sub>	Holds information about how Charging Characteristics were selected.

## 4.6 SMS-MT data in SGSN (S-SMT-CDR)

If enabled, an SGSN Mobile terminated SMS record shall be produced for each short message received by a mobile subscriber via the SGSN. The fields in the record are specified in Table 5. The table provides a brief description of each field. A more elaborate definition of the fields, sorted by the field name in alphabetical order, is provided in Section 5.

**Table 5: SGSN Mobile terminated SMS record (S-SMT-CDR)**

Field	Category	Description
Record Type	M	SGSN Mobile Terminated SMS.
Served IMSI	M	The IMSI of the subscriber.
Served IMEI	O <sub>C</sub>	The IMEI of the ME, if available.
Served MSISDN	M	The primary MSISDN of the subscriber.
MS Network Capability	O <sub>M</sub>	The mobile station network capability
Service Centre	O <sub>M</sub>	The address (E.164) of the SMS-service centre.
Recording Entity	O <sub>M</sub>	The E.164 number of the SGSN.
Location Area Code	O <sub>M</sub>	The Location Area Code to which the message was delivered.
Routing Area Code	O <sub>M</sub>	The Routing Area Code to which the message was delivered.
Cell Identifier	O <sub>M</sub>	The Cell Identity for GSM or Service Area Code (SAC) for UMTS to which the message was delivered.
Event Time Stamp	M	Delivery time stamp, time at which message was sent to the MS by the SGSN.
SMS Result	C	The result of the attempted delivery if unsuccessful.
Record Extensions	O <sub>C</sub>	A set of network operator / manufacturer specific extensions to the record. Conditioned upon the existence of an extension.
Node ID	O <sub>M</sub>	Name of the recording entity.
Local Record Sequence Number	O <sub>M</sub>	Consecutive record number created by this node. The number is allocated sequentially including all CDR types.
Charging Characteristics	M	The Charging Characteristics flag set used by the SGSN.
System Type	O <sub>C</sub>	Indicates the type of air interface used, e.g. UTRAN. This field is present when either the UTRAN or GERAN air-interface is used. It is omitted when the service is provided by a GSM air interface.
Charging Characteristics Selection Mode	O <sub>M</sub>	Holds information about how Charging Characteristics were selected.

---

## 5. Description of Record Fields

This subclause contains a brief description of each field of the CDRs described in the previous subclause. The fields are listed in alphabetical order according to the field name as specified in one of the five tables above.

### 5.1 Access Point Name (APN) Network/Operator Identifier

These fields contain the actual connected Access Point Name Network/Operator Identifier determined either by MS, SGSN or modified by CAMEL service. An APN can also be a wildcard, in which case the SGSN selects the access point address.

Following TS 23.003 [7], the APN field is specified in the CDR by two variable strings. The first is the APN Network Identifier (NI portion) and the second is the APN Operator Identifier (OI portion). The APN NI may contain one or more label as described in TS 23.003 [7]. The APN OI is composed of three labels. The first and second labels together shall uniquely identify the PLMN operator (e.g. "mnc<operator mnc>.mcc<operator mcc>.gprs").

To represent the APN NI and OI in the GPRS CDRs, the "dot" notation shall be used.

See 3GPP TS 23.003 [7] and 3GPP TS 23.060 [2] for more information about APN format and access point decision rules.

### 5.2 APN Selection Mode

This field indicates how the SGSN selected the APN to be used. The values and their meaning are as specified in 3GPP TS 29.060 [8] subclause 7.9 'Information elements'.

### 5.3 CAMEL Information

This field includes following CAMEL information elements for PDP context (S-CDR), Attach/Detach session (M-CDR) and Mobile originated SMS (S-SMO-CDR) if corresponding CAMEL service is activated.

- CAMEL Access Point Name NI (S-CDR)

This field contains the network identifier part of APN before modification by the CSE.

- CAMEL Access Point Name OI (S-CDR)

This field contains the operator identifier part of APN before modification by the CSE.

- CAMEL Calling Party Number (S-SMO-CDR)

This field contains the Calling Party Number modified by the CAMEL service.

- CAMEL Destination Subscriber Number (S-SMO-CDR)

This field contains the short message Destination Number modified by the CAMEL service.

- CAMEL SMSC Address (S-SMO-CDR)

This field contains the SMSC address modified by the CAMEL service.

- SCF address (S-CDR, M-CDR, S-SMO-CDR)

This field identifies the CAMEL server serving the subscriber. Address is defined in HLR as part of CAMEL subscription information.

- Service key (S-CDR, M-CDR, S-SMO-CDR)

This field identifies the CAMEL service logic applied. Service key is defined in HLR as part of CAMEL subscription information.

- Default Transaction/SMS Handling (S-CDR, M-CDR, S-SMO-CDR)

This field indicates whether or not a CAMEL encountered default GPRS- or SMS-handling. This field shall be present only if default call handling has been applied. Parameter is defined in HLR as part of CAMEL subscription information.

- Free Format Data (S-CDR, M-CDR, S-SMO-CDR)

This field contains charging information sent by the gsmSCF in the Furnish Charging Information GPRS messages as defined in 3GPP TS 29.078 [9]. The data can be sent either in one FCI message or several FCI messages with append indicator. This data is transferred transparently in the CAMEL sections of the relevant call records.

If the FCI is received more than once during one CAMEL call, the append indicator defines whether the FCI information is appended to previous FCI and stored in the relevant record or the information of the last FCI received is stored in the relevant record (the previous FCI information shall be overwritten).

In the event of partial output the currently valid 'Free format data' is stored in the partial record.

- FFD Append Indicator (S-CDR, M-CDR)

This field contains an indicator whether CAMEL free format data is to be appended to free format data stored in previous partial CDR. This field is needed in CDR post processing to sort out valid free format data for that call leg from sequence of partial records. Creation of partial records is independent of received FCIs and thus valid free format data may be divided to different partial records.

If field is missing then free format data in this CDR replaces all received free format data in previous CDRs. Append indicator is not needed in the first partial record. In following partial records indicator shall get value true if all FCIs received during that partial record have append indicator. If one or more of the received FCIs for that call leg during the partial record do not have append indicator then this field shall be missing.

- Level of CAMEL services (S-CDR, M-CDR)

This field describes briefly the complexity of CAMEL invocation. Categories are the same as in circuit switched services and measure of resource usage in VPLMN requested by HPLMN.

- 'Basic' means that CAMEL feature is invoked during the PDP context activation phase only (e.g. to modify APN\_NI / APN\_OI).

- 'Call duration supervision' means that PDP context duration or volume supervision is applied in the gprsSSF of the VPLMN (Apply Charging message is received from the gsmSCF)

- Number of DPs encountered (S-CDR, M-CDR)

This field indicates how many armed CAMEL detection points (TDP and EDP) were encountered and complements 'Level of CAMEL service' field.

## 5.4 Cause for Record Closing

This field contains a reason for the release of the CDR including the following:

- normal release: PDP context release or GPRS detach;
- partial record generation: data volume limit, time (duration) limit, SGSN change or maximum number of changes in charging conditions;
- abnormal termination (PDP or MM context);
- management intervention (request due to O&M reasons).

A more detailed reason may be found in the diagnostics field.

## 5.5 Cell Identifier

For GSM, the Cell Identifier is defined as the Cell Id, reference 24.008[10], and for UMTS it is defined as the Service Area Code in TS 25.413 [11].

## 5.6 Charging Characteristics

The Charging Characteristics field allows the operator to apply different kind of charging methods in the CDRs. A subscriber may have Charging Characteristics assigned to his subscription. These characteristics can be supplied by the HLR to the SGSN as part of the subscription information, and, upon activation of a PDP context, the SGSN forwards the charging characteristics to the GGSN according to the rules specified in Annex A. This information can be used by the GSNs to activate CDR generation and control the closure of the CDR or the traffic volume containers (see subclause 5.15). It can also be used in nodes handling the CDRs (e.g., the CGF or the billing system) to influence the CDR processing priority and routing. These functions are accomplished by specifying the charging characteristics as sets of charging profiles and the expected behaviour associated with each profile. The interpretations of the profiles and their associated behaviours can be different for each PLMN operator and are not subject to standardisation. In this document only the charging characteristic formats and selection modes are specified.

The functional requirements for the Charging Characteristics as well as the profile and behaviour bits are further defined in normative Annex A, including the definitions of the trigger profiles associated with each CDR type.

The format of charging characteristics field is depicted in Figure 4. Px (x =0..3) refers to the Charging Characteristics Profile index. Bits classified with a “B” may be used by the operator for non-standardised behaviour (see Annex A).

It is possible to ascribe the same semantic meanings to bits P0 through P3 as exists in release 99 technical specification TS 32.015 [12]. That is, the P3 (N) flag in the Charging Characteristics indicates normal charging, the P2 (P) flag indicates prepaid charging, the P1 (F) flag indicates flat rate charging and the P0 (H) flag indicates charging by hot billing. For example, the case where the P0 bit is turned on would correspond to the behaviour associated with the operator’s own definition of Hot Billing, such as short time and volume limits for CDR closure as well as priority processing by CDR handling nodes (e.g., CGF and billing system). It is the responsibility of the PLMN operator to exactly define the meaning of the profile bits, P0 to P3, and make them compatible with the R99 flags if so required.

**Figure 4: Charging Characteristics flags**

## 5.7 Charging Characteristics Selection Mode

This field indicates the charging characteristic type that the GSNs applied to the CDR. In the SGSN the allowed values are:

- Home default

- Visiting default
- Roaming default
- APN specific
- Subscription specific

In the GGSN the allowed values are:

- Home default
- Visiting default
- Roaming default
- SGSN supplied.

Further details are provided in Annex A.

## 5.8 Charging ID

This field is a charging identifier, which can be used together with GGSN address to identify all records produced in SGSN(s) and GGSN involved in a single PDP context. Charging ID is generated by GGSN at PDP context activation and transferred to context requesting SGSN. At inter-SGSN routing area update charging ID is transferred to the new SGSN as part of each active PDP context.

Different GGSNs allocate the charging ID independently of each other and may allocate the same numbers. The CGF and/or BS may check the uniqueness of each charging ID together with the GGSN address and optionally (if still ambiguous) with the record opening time stamp.

## 5.9 Destination Number

This field contains short message Destination Number requested by the user. See 32.205 [4].

## 5.10 Diagnostics

This field includes a more detailed technical reason for the release of the connection and may contain one of the following:

- a MAP error from 3GPP TS 29.002 [13]; or
- a Cause from 3GPP TS 29.078 [9]; or
- a Cause from 3GPP TS 24.008 [10]; or
- a Cause from ISUP Q.767 [14].

The diagnostics may also be extended to include manufacturer and network specific information.

## 5.11 Duration

This field contains the relevant duration in seconds for PDP contexts (S-CDR, G-CDR, and attachment (M-CDR)). It is the duration from Record Opening Time to record closure. For partial records this is the duration of the individual partial record and not the cumulative duration.

It should be noted that the internal time measurements may be expressed in terms of tenths of seconds or even milliseconds and, as a result, the calculation of the duration may result in the rounding or truncation of the measured duration to a whole number of seconds.

Whether or not rounding or truncation is to be used is considered to be outside the scope of the present document subject to the following restrictions:

- 1) A duration of zero seconds shall be accepted providing that the transferred data volume is greater than zero.
- 2) The same method of truncation/rounding shall be applied to both single and partial records.

## 5.12 Dynamic Address Flag

This field indicates that PDP address has been dynamically allocated for that particular PDP context. This field is missing if address is static i.e. part of PDP context subscription. Dynamic address allocation might be relevant for charging e.g. the duration of PDP context as one resource offered and possible owned by network operator.

## 5.13 Event Time Stamps

These fields contain the event time stamps relevant for each of the individual record types.

All time-stamps include a minimum of date, hour, minute and second.

## 5.14 GGSN Address Used

These fields are the current serving GGSN IP Address for the Control Plane.

## 5.15 List of Traffic Data Volumes

This list includes one or more containers, each includes the following fields:

**Data Volume Uplink, Data Volume Downlink, Change Condition and Change Time.**

**Data Volume, Uplink** and/or **Downlink**, includes the number of octets transmitted during the use of the packet data services in the uplink and/or downlink direction, respectively.

**Change Condition** defines the reason for closing the container (see TS 32.200 [3] Section 6), such as tariff time change, QoS change or closing of the CDR. **Change Time** is a time stamp, which defines the moment when the new volume counts are started or the CDR is closed. All the active PDP contexts do not need to have exactly the same time stamp e.g. due to same tariff time change (variance of the time stamps is implementation and traffic load dependent, and is out of the scope of standardisation).

First container includes following optional fields: QoS Requested (not in G-CDR) and QoS Negotiated. In following containers QoS Negotiated is present if previous change condition is QoS change.

Table 6 illustrates an example of a list, which has three containers (sets of volume counts) caused by one QoS change and one tariff time change.

**Table 6: Example list of traffic data volumes**

QoS Requested = QoS1 QoS Negotiated = QoS1	QoS Negotiated = QoS2	
Data Volume Uplink = 1 Data Volume Downlink = 2	Data Volume Uplink = 5 Data Volume Downlink = 6	Data Volume Uplink = 3 Data Volume Downlink = 4
Change Condition = QoS change Time Stamp = TIME1	Change Condition = Tariff change Time Stamp = TIME2	Change Condition = Record closed Time Stamp = TIME3

First container includes initial QoS values and corresponding volume counts. Second container includes new QoS values and corresponding volume counts before tariff time change. Last container includes volume counts after the tariff time change. The total volume counts can be itemised as shown in Table 7 (tariff1 is used before and tariff2 after the tariff time change):

**Table 7: Itemised list of total volume count corresponding to Table 6**

		<b>Container</b>
QoS1+Tariff1	uplink = 1, downlink = 2	1
QoS2+Tariff1	uplink = 5, downlink = 6	2
QoS2+Tariff2	uplink = 3, downlink = 4	3
QoS1	uplink = 1, downlink = 2	1
QoS2	uplink = 8, downlink = 10	2+3
Tariff1	uplink = 6, downlink = 8	1+2
Tariff2	uplink = 3, downlink = 4	3

The amount of data counted in the GGSN shall be the payload of the GTP-U protocol at the Gn interface. Therefore the data counted already includes the IP PDP bearer protocols i.e. IP or PPP.

The data volume counted in the SGSN is dependent on the system. For GSM SGSN the data volume is the payload of the SNDCP PDUs at the Gb interface. For UMTS-SGSN it is the GTP-U PDUs at the Iu-PS interface. Therefore, in both systems, the data counted already includes the overheads of any PDP bearer protocols.

In GSM, in order to avoid that downstream packets transmitted from the old SGSN to the new SGSN at inter SGSN RA update induce the increase of the PDP CDR downstream volume counters in both SGSN the following rules must be followed:

- For PDP contexts using LLC in unacknowledged mode: an SGSN shall update the PDP CDR when the packet has been sent by the SGSN towards the MS;
- For PDP contexts using LLC in acknowledged mode, a GSM-SGSN shall only update the PDP CDR at the reception of the acknowledgement by the MS of the correct reception of a downstream packet. In other words, for inter SGSN RA update, the new SGSN shall update the PDP CDR record when a downstream packet sent by the old SGSN is received by the MS and acknowledged by the MS towards the new SGSN through the RA update complete message.

In UMTS, the not transferred downlink data can be accounted for in the S-CDR with 'RNC Unsent Downlink Volume' field, which is the data that the RNC has either discarded or forwarded during handover. Data volumes retransmitted (by RLC or LLC) due to poor radio link conditions shall not be counted.

## 5.16 Local Record Sequence Number

This field includes a unique record number created by this node. The number is allocated sequentially including all CDR types. The number is unique within one node, which is identified either by field Node ID or by record-dependent node address (SGSN address, GGSN address, Recording Entity).

The field can be used e.g. to identify missing records in post processing system.

## 5.17 Message reference

This field contains a unique message reference number allocated by the Mobile Station (MS) when transmitting a short message to the service centre. This field corresponds to the TP-Message-Reference element of the SMS\_SUBMIT PDU defined in 3GPP TS 23.040 [15].

## 5.18 MS Network Capability

This MS Network Capability field contains the MS network capability value of the MS network capability information element of the served MS on PDP context activation or on GPRS attachment as defined in 3GPP TS 24.008 [10].

## 5.19 Network Initiated PDP Context

This field indicates that PDP context is network initiated. The field is missing in case of mobile activated PDP context.

## 5.20 Node ID

This field contains an optional, operator configurable, identifier string for the node that had generated the CDR. The Node ID may or may not be the DNS host name of the node.

## 5.21 PDP Type

This field defines the PDP type, e.g. IP, PPP, or IHOSP:OSP (see 3GPP TS 29.060 [8] for exact format).

## 5.22 QoS Requested/QoS Negotiated

Quality of Service Requested contains the QoS desired by MS at PDP context activation. QoS Negotiated indicates the applied QoS accepted by the network.

If a pre-Release 99 only capable terminal is served, the QoS profile consists of five (5) attributes as follows: reliability, delay, precedence, peak throughput and mean throughput. The encoding of this QoS profile shall be in accordance with GSM 12.15.

In Release 99 and R4, the QoS profile consists of the above 2G parameters plus the following UMTS attributes: Traffic class ('conversational', 'streaming', 'interactive', 'background'), Maximum bit-rate (kbps), Delivery order (y/n), Maximum SDU size (octets), SDU error ratio, Residual bit error ratio, Delivery of erroneous SDUs (y/n/-), Transfer delay (ms), Traffic handling priority, Allocation/Retention Priority. This QoS profile shall be encoded according to the "Quality of Service (QoS) Profile" parameter specified in 3GPP TS 29.060 [8].

## 5.23 Record Extensions

This field enables network operators and/or manufacturers to add their own recommended extensions to the standard record definitions. This field contains a set of "management extensions" as defined in ITU-T X.721 [16]. This is conditioned upon the existence of an extension.

## 5.24 Record Opening Time

This field contains the time stamp when the MS is attached to a SGSN (M-CDR) or PDP context is activated in SGSN/GGSN (S-CDR, G-CDR) or record opening time on subsequent partial records (see 3GPP TS 32.205 [4] for exact format).

Record opening reason does not have a separate field. For G-CDR and M-CDR it can be derived from the field "Sequence number"; i.e. either a missing field or a value one (1) means activation of PDP context and GPRS attachment. For the S-CDR the field "SGSN change" also needs to be taken into account.

## 5.25 Record Sequence Number

This field contains a running sequence number employed to link the partial records generated in the SGSN/GGSN for a particular MM context or PDP context (characterised with the same Charging ID and GGSN address pair). For M-CDR or S-CDR the sequence number always restarts from one (1) after an inter-SGSN routing area update, see field "SGSN change". The Record Sequence Number is missing if the record is the only one produced in the SGSN/GGSN for an MM context or a PDP context CDR (e.g. inter-SGSN routing area update can result to two M-CDR or two S-CDRs without sequence number and field "SGSN change" present in the second record).

## 5.26 Record Type

The field identifies the type of the record e.g. S-CDR, G-CDR, M-CDR, S-SMO-CDR and S-SMT-CDR.

## 5.27 Recording Entity Number

This field contains the ITU-T E.164 number assigned to the entity that produced the record. For further details see 3GPP TS 23.003 [7].

## 5.28 RNC Unsent Downlink Volume

This field contains the unsent downlink volume that the RNC has either discarded or forwarded to 2G-SGSN and already included in S-CDR. This field is present when RNC has provided unsent downlink volume count at RAB release and can be used by a downstream system to apply proper charging for this PDP context.

## 5.29 Routing Area Code/Cell Identifier/Change of location

The location information contains a combination of the Routing Area Code (RAC) and an optional Cell Identifier of the routing area and cell in which the served party is currently located. In GSM the Cell Identifier is defined by the Cell Identity (CI) and in UMTS by the Service Area Code (SAC). Any change of location (i.e. Routing Area change) may be recorded in the change of location field including the time at which the change took place.

The change of location field is optional and not required if partial records are generated when the location changes.

The RAC and (optionally) CI are coded according to 3G TS 24.008 [10] and the SAC according 3GPP TS 25.413 [11].

## 5.30 Served IMEI

This field contains the International Mobile Equipment Identity (IMEI) of the equipment served, if available. The term "served" equipment is used to describe the ME involved in the transaction recorded e.g. the called ME in the case of a network initiated PDP context.

The structure of the IMEI is defined in 3GPP TS 23.003 [7].

## 5.31 Served IMSI

This field contains the International Mobile Subscriber Identity (IMSI) of the served party. The term "served" party is used to describe the mobile subscriber involved in the transaction recorded e.g. the calling subscriber in case of a mobile initiated PDP context.

The structure of the IMSI is defined in 3GPP TS 23.003 [7].

## 5.32 Served MSISDN

This field contains the Mobile Station (MS) ISDN number (MSISDN) of the served party. The term "served" party is used to describe the mobile subscriber involved in the transaction recorded. In case of multi-numbering the MSISDN stored in a GPRS CDR will be the primary MSISDN of the calling party.

The structure of the MSISDN is defined in 3GPP TS 23.003 [7].

## 5.33 Served PDP Address

This field contains the PDP address of the served IMSI. This is a network layer address i.e. of type IP version 4 or IP version 6. The address for each PDP type is allocated either temporarily or permanently (see "Dynamic Address Flag"). This parameter shall be present except when both the PDP type is PPP and dynamic PDP address assignment is used.

## 5.34 Service Centre Address

This field contains a ITU-T E.164 number identifying a particular service centre e.g. Short Message Service (SMS) centre (see 3GPP TS 23.040 [15]).

## 5.35 SGSN Address

These fields contain one or several IP addresses of SGSN. The IP address of the SGSN can be either control plane address or user plane address.

The S-CDR fields contain single address of current SGSN and GGSN used.

The G-CDR fields contain the address of the current GGSN and a list of SGSNs addresses, which have been connected during the record (SGSN change due to inter SGSN Routing Area update).

The M-CDR fields only contain the address of the current SGSN. It does not provide any information related to active PDP context(s) and thus the connected (used) GGSN(s) cannot be identified.

## 5.36 SGSN Change

This field is present only in the S-CDR to indicate that this is the first record after an inter-SGSN routing area update.

## 5.37 Short Message Service (SMS) Result

This field contains the result of an attempt to deliver a short message either to a service centre or to a mobile subscriber (see 3GPP TS 29.002[13]). Note that this field is only provided if the attempted delivery was unsuccessful.

## 5.38 System Type

This field is present conditionally, indicating the use of the UTRAN or GERAN air-interface for the provision of service recorded by this CDR. In the case of service provided by a GSM air interface, this field is not present.

Note that the ASN.1 contains a value of “unknown” which may be used in other domains but not in the PS domain.

---

## 6. Charging Data Record Structure

### 6.1 ASN.1 definitions for CDR information

The ASN.1 definitions are based on ISO8824 (90) / X.208 (88) [17], which has been superseded by ISO8824-1 (94) / X.680 (94)[18]. This newer version not only includes new features but also removes some that were present in ISO8824 (90) / X.208 (88) [17]. Where possible, the GPRS work would be based on those ASN.1 features to both. However, where necessary, the new features in ISO8824-1 (94) / X.680 (94) [18] be used in some places. ISO8824 (90) / X.208 (88) [17] features that are no longer in ISO8824-1 (94) / X.680 (94) [18] will not be used.

## 7. Charging Protocols

The GTP' charging protocol is optional, and is used for CDR transport between the GSNs and the CGF.

The CGF-BS interface is also described in this subclause.

### 7.1 CDR Transport by GTP'

The GTP' has been designed to deliver packets of data to the CGF(s) from the network elements that generate charging records. This protocol is required when the CGF resides outside the CDR generating nodes and utilizes some aspects of GTP (defined in 3GPP TS 29.060 [8]), which is used for packet data tunnelling in the backbone network.

GTP' operates on the Ga interface and does not imply the use of any specific backbone network.

GTP' contains the following functions:

- CDR-transfer mechanisms between the GSNs and the CGF.
- Re-direction of CDR transfer to another CGF.
- Ability to detect communication failures between the communicating peers using echo messaging.
- Ability of a CDR handling node to advertise to peers about its CDR transfer capability (e.g., after a period of service downtime).
- An ability to prevent duplicate CDRs that might arise during redundancy operations. If so configured, the CDR duplication prevention function may also be carried out by marking potentially duplicated CDR packets, and, delegating the final duplicate deletion task to a CGF or a Billing System - BS (instead of handling the possible duplicates solely by GTP' messaging).

#### 7.1.1 SGSN - CGF communication

As illustrated in Figure 5, the SGSN - CGF communications are carried out using GTP' over UDP/TCP and IP.

**Figure 5: Protocol layers between the SGSN and the CGF**

#### 7.1.2 GGSN - CGF communication

The GGSN - CGF communications are conducted using GTP' over UDP/TCP and IP, as depicted in Figure 6:

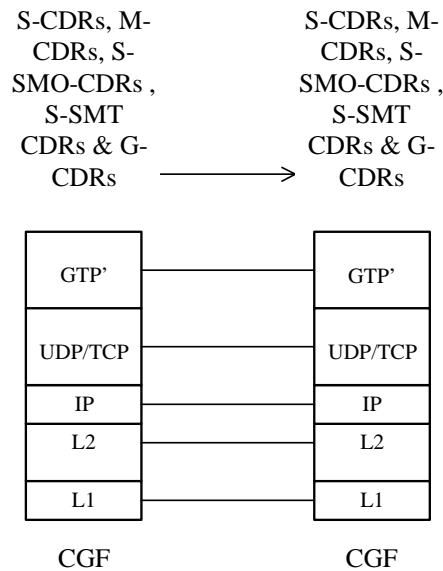

**Figure 6: Protocol layers between the GGSN and the CGF**

### 7.1.3 CGF - CGF communication

If necessary, CGF to CGF communications are carried out using GTP' over UDP/TCP and IP. This is illustrated in Figure 7.

**Figure 7: Protocol layers between CGFs**

### 7.1.4 Port usage

Transporting the CDRs from the GSNs to the CGF over the Ga interface may facilitate charging. The Path Protocol may be UDP (compliant with STD 0006[19]) or TCP (compliant with STD 0007[20]) over IP. 7.1.4.1 UDP as the Path Protocol

Ports for signalling the request messages:

- The UDP Destination Port may be the server port number 3386 which has been reserved for GTP'. Alternatively another port can be used, which has been configured by O&M.
- The UDP Source Port is a locally allocated port number at the sending GSN.

Ports for signalling the response messages:

- The UDP Destination Port value shall be the value of the Source Port of the corresponding request message.
- The UDP Source Port shall be the value from the Destination Port of the corresponding request message.

#### 7.1.4.2 TCP as Path Protocol

The TCP Destination Port may be the server port number 3386, which has been reserved for G-PDUs. Alternatively, another port may be used as configured by O&M. Extra implementation-specific destination ports are possible but all CGFs shall support the server port number.

The TCP Source Port is a random port, locally assigned at the sending GSN.

#### 7.1.4.3 Network layer and lower layers

Beneath the Path Protocol there is the network IP layer, which shall be the Internet Protocol (IP) compliant with STD 0005(see [21] and [22]). Beneath the network IP layer are the L2 and L1 layers, which are not specified, in the present document.

### 7.1.5 Charging related requirements for PS Domain nodes

Each node (e.g., SGSN, GGSN etc. and CGF) that supports or may support GTP' shall be capable of handling or responding with a "*Service/Version not supported*" message if that node is configured to be addressed by another peer node.

When a new PDP context is activated or after an inter SGSN handover the GGSN will inform the related SGSN which CGF it should send its CDRs to. All other non-PDP context related CDRs are sent to the current default CGF for that CDR generating node. Each CDR generating node will have an O&M configurable CGF address list to which it can send its CDRs. The list will be organized in CGF address priority order. If the Primary CGF is not available (e.g., out of service) then the CDR generating node shall send the CDRs to the Secondary CGF and so on.

Each CDR generating node will only send the records to the CGF(s) of the same PLMN, not to CGF(s) located in other PLMNs.

Each CGF in the PLMN may know of other CGFs' network addresses (e.g., for redundancy reasons, to be able to recommend another CG address with the Redirection Request message). This is achieved by O&M configuration facilities that will enable each CGF to have a configurable list of peer CGF addresses.

## 7.2 The GTP' charging protocol

This sub clause describes the features of GTP'. The message types described in sub clause 7.3.2 ("Reused GTP message types") are also described in the related subchapters of 3GPP TS 29.060 [8].

### 7.2.1 Usage of GTP Header in charging

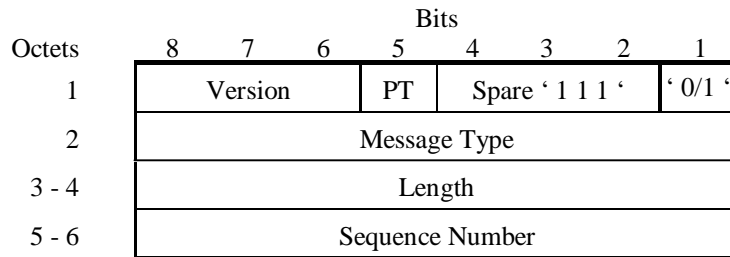

In GTP' messaging only the signalling plane of GTP is partly reused. The GTP' header is shown in Figure 8.

Bit 5 of octet 1 of the GTP header is the Protocol Type (*PT*) flag and is '0' if the message is GTP'.

The *Version* bits indicate the GTP' protocol version when the Protocol Type flag is '0'.

Bit 1 of octet 1 is not used in GTP' (except in v0), and it is marked '0' in the GTP' header. It is in use in GTP' v0 and distinguishes the used header-length. In the case of GTP' v0, this bit being marked one (1) indicates the usage of the 6 octets header. If the bit is set to '0' (usually the case) the 20-octet header is used. For all other versions of GTP' this bit is not used and is set to '0'. However, this does not suggest the use of the 20-octet header, rather a shorter 6-octet header.

The *Length* indicates the length of payload (number of octets after the GTP' header). The *Sequence Number* of the packet is part of the GTP' header.

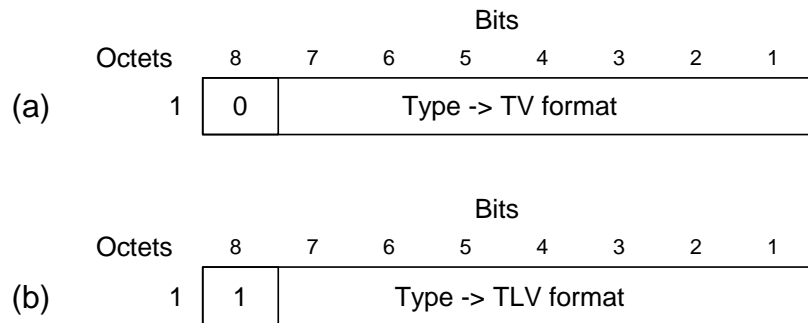

**Figure 8: GTP' header**

## 7.2.2 Information Elements (IEs)

The messages may contain several Information Elements (IEs). The TLV (Type, Length, Value) or TV (Type, Value) encoding formats shall be used for the GTP' IEs. The GTP' messages shall have the IEs sorted with the *Type* fields in ascending order. The *Length* field shall contain the IE length excluding the Type and Length fields.

Within the *Type* field the most significant bit will be set to 0 when the TV format is used and set to 1 when the TLV format is used. This is illustrated in Figures 9a and b, respectively.

**Figure 9: Type field for (a) TV and (b) TLV format**

## 7.3 GTP' Message Types

### 7.3.1 List of all GTP' message types

GTP' defines a set of messages between two associated nodes. The GTP' messages defined are shown in Table 8. The messages introduced by GTP' are in **boldface** letters. The other messages are inherited from the GTP protocol.

Of the GTP' introduced signalling message types, *Node Alive Request*, *Node Alive Response*, *Redirection Request* and *Redirection Response* belong to the "Path Management messages". The *Data Record Transfer Request* and *Data Record Transfer Response* are form the message type group "Record Transmission messages".

The reserved fields in the signalling messages shall be filled with ones, and are intended for future use.

GTP' reuses the GTP **Cause** values. The message type numbers required for the newly introduced GTP' messages have been derived from the unallocated message type number space specified in the GTP message table defined in 3GPP TS 29.060 [8].

The number ranges allocated for GTP' are as follows:

For Information Elements: 117-127 (TV type fields) and 239-254 (for TLV type fields).

TLV Information Element types introduced in the present document:

- 254 *Address of Recommended Node*
- 253 *Requests Responded*
- 252 *Data Record Packet*
- 251 *Charging Gateway Address* (this IE is also used in 3GPP TS 29.060 [8])
- 250 *Sequence Numbers of Cancelled Packets*
- 249 *Sequence Numbers of Released Packets*

TV Information Element types introduced in the present document:

- 127 *Charging ID*
- 126 *Packet Transfer Command*

For **Cause** Codes: **Cause** values used in requests: 49 to 63, **Cause** values used in responses indicating acceptance: 177 to 191, **Cause** values used in responses indicating rejection: 241 to 255.

Charging related **Cause** values introduced for the present document:

In requests:

- 63 *This node is about to go down*
- 62 *Another node is about to go down*
- 61 *The receive buffers are becoming full*
- 60 *The transmit buffers are becoming full*
- 59 *System failure*

In responses indicating acceptance:

- 177 *CDR decoding error*

In responses indicating rejection:

- 255 *Request not fulfilled*
- 254 *Sequence numbers of released/cancelled packets IE incorrect*
- 253 *Request already fulfilled*
- 252 *Request related to possibly duplicated packets already fulfilled*

The charging related message types are listed in Table 8. Brief descriptions of the GTP messages reused in GTP' are provided in subclause 7.3.2 ("Reused GTP message types") below. Further details are provided in 3GPP TS 29.060 [8], the GTP specification.

**Table 8: GTP' messages**

Message Type value (Decimal)	GTP' message
1	Echo Request
2	Echo Response
3	Version Not Supported
<b>4</b>	<b>Node Alive Request</b>
<b>5</b>	<b>Node Alive Response</b>
<b>6</b>	<b>Redirection Request</b>
<b>7</b>	<b>Redirection Response</b>
<b>240</b>	<b>Data Record Transfer Request</b>
<b>241</b>	<b>Data Record Transfer Response</b>
others	reserved for future use

### 7.3.2 Reused GTP message types

The existing *Echo Request* and *Echo Response* messages defined in 3GPP TS 29.060 [8] are also used in PS domain charging. They may be used by the CDR generating nodes SGSN or GGSN, or by the CGF for checking if another GSN or CGF is alive. If the present document and 3GPP TS 29.060 [8] differ in their description then the 3GPP TS 29.060

[8] is to be taken as the latest specification status of the related Information Elements. If the path protocol is TCP, *Echo Request* and *Echo Response* messages are not required.

The *Version Not Supported* message in the GTP' resembles the corresponding GTP message. It indicates the latest GTP' version that the GTP' entity can support. If a receiving node receives a GTP' message of an unsupported version, then that node shall return a GTP' *Version Not Supported* message indicating in the Version field of the GTP' header the latest GTP' version that that node supports. The received payload data of the GTP' packet shall then be discarded.

The *Version* bits in the GTP' header have currently the following possible values:

- GTP' version 0 (binary '000') identifies the following Message Type values:

3 = *Version Not Supported*,

4 = *Node Alive Request*,

5 = *Node Alive Response*,

6 = *Redirection Request*,

7 = *Redirection Response*.

In clause 7.3.4.6 the Requests Responded information element has Length field in place of the Number of Requests Responded field, to make that TLV IE to be handled like normal TLV IEs.

If GTP' v0 is used in parallel with GTP' v2 or a later version, then, a 6-octet header length (with no trailing dummy octets) is used also with v0 (like in GTP' v2).

The mark of the usage of GTP' v0 with 6 octet header (instead of the original 20 octet long header) is then the version bits being 0 and the bit 1 of octet 1 being '1' (instead of '0').

- GTP' version 1 (binary '001') is the same as version 0 but has, in addendum, the duplicate CDR prevention mechanism, introduced in GSM 12.15 version 7.2.1 (1999-07) of the GPRS charging specification.
- GTP' version 2 (binary '010') is the same as version 1, but the header is just 6 octets long (no unused trailing octets). IPv6 address type is also supported (for Address of Recommended Node information element of the Redirection Request).

### 7.3.3 GTP message type modifications implied by GTP'

The PS domain charging related features in GTP are in the Create PDP Context Response: the Charging ID Information Element (IE) and the Charging Gateway Address IE, in the Update PDP Context Response the Charging ID Information Element (IE) and the Charging Gateway Address IE, in the Create AA PDP Context Response: the Charging ID IE and the Charging Gateway Address IE. Refer to 3GPP TS 29.060 [8] for details.

The general principle is that the CDRs are always sent to a CGF residing in the same network as the CDR generating node. In the case of roaming it is conceivable that some CDRs relating to the same PDP context will be sent to different networks' CGFs. The cost balancing of the roaming traffic is to be agreed between the UMTS Operators.

### 7.3.4 GTP' message types

#### 7.3.4.1 Node Alive Request

The *Node Alive Request* message may be used to inform that a node in the network has started its service (e.g. after a service break due to software or hardware maintenance or data service interruption after an error condition). A node may send a different Node Address than its own in the Information Element, e.g. informing the "next node in the chain" that the "previous node in the chain" (which is located on the other side of the sender of this message) is now ready for service. This message type is optional if the Path Protocol is TCP.

The *Node Alive Request* message allows a quicker reconnect capability than the *Echo Request* message based polling can provide, and its usage will have a reduced load effect on the network, particularly when the number of network

nodes using GTP' is high. It may also be used to inform when a new network node has become available for service. If the *Echo Request* message is also used then the usage of the *Node Alive Request* message allows the interval of *Echo Requests* to be longer than would be otherwise required, thus reducing network loading with many *Echo Requests*. The Information elements in a Node Alive Request message are shown in Table 9.

**Table 9: Information Elements in a Node Alive Request**

Information Element	Presence requirement
Node Address	Mandatory
Private Extension	Optional

The Node Address format is the same as for the Charging Gateway Address format described in 3GPP TS 29.060 [8]).

The optional Private Extension IE contains vendor- or operator-specific information.

### 7.3.4.2 Node Alive Response

The *Node Alive Response* message, shown in Table 10, shall be sent as a response to a received *Node Alive Request*.

**Table 10: Information Elements in a Node Alive Response**

Information Element	Presence requirement
Private Extension	Optional

The optional Private Extension IE contains vendor- or operator-specific information.

### 7.3.4.3 Redirection Request

There are two kinds of usage for the *Redirection Request* message. One is to advise that received CDR traffic is to be redirected to another CGF due to that CGF node is about to stop service (due to an outage for maintenance or an error condition). The second purpose is to inform a CDR generating node (e.g. SGSN) that is currently sending data to this node (e.g. CGF), that the next node in the chain (e.g. a mediator device or Billing Computer) has lost connection to this node (e.g. CGF).

The Information Elements in a *Redirection Request* Message are listed in Table 11. An *Address of Recommended Node* may be given if for example a CGF maintenance outage is handled by first introducing another CGF ready to take incoming CDRs. In this way the network performance can be maintained. The *Address of Recommended Node* shall only describe an intra-PLMN node containing a CGF, and not to a node in any other PLMN.

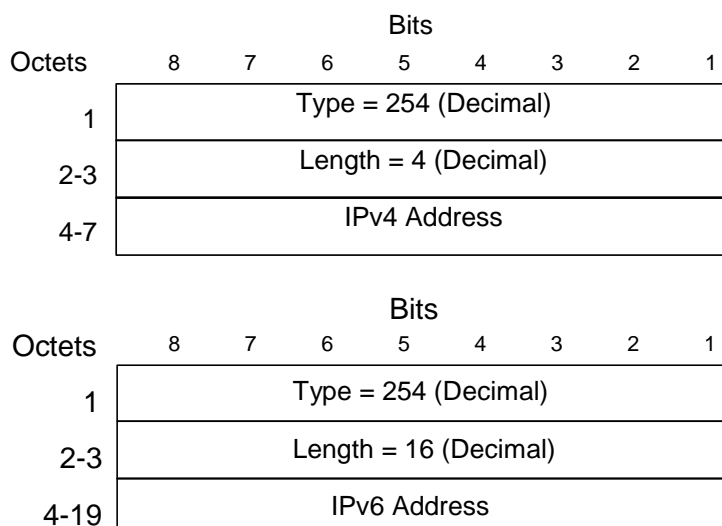

**Table 11: Information Elements in a Redirection Request**

Information Element	Presence requirement
Cause	Mandatory
Address of Recommended Node	Optional
Private Extension	Optional

Possible **Cause** values are:

- "This node is about to go down";
- "Another node is about to go down";
- "System failure";
- "Receive buffers becoming full";
- "Send buffers becoming full".

The *Address of Recommended Node* information element, shown in Figure 10, defines the IPv4 or IPv6 format address that the node is identified by in the UMTS network.

**Figure 10: Address of Recommended Node information elements**

The optional Private Extension contains vendor- or operator- specific information.

### 7.3.4.4 Redirection Response

A *Redirection Response* message shall be sent as a response of a received *Redirection Request*. The information elements of this message are listed in Table 12.

**Table 12: Information Elements in a Redirection Response**

Information Element	Presence requirement
Cause	Mandatory
Private Extension	Optional

Possible **Cause** values are:

- "Request Accepted";
- "No resources available";
- "Service not supported";
- "System failure";
- "Mandatory IE incorrect";
- "Mandatory IE missing";
- "Optional IE incorrect";
- "Invalid message format";
- "Version not supported".

The optional Private Extension contains vendor- or operator-specific information.

### 7.3.4.5 Data Record Transfer Request

This message is used in PS domain charging to transmit the CDR information. The CDR information is placed in the Data Record information element.

#### 7.3.4.5.1 General logic

This subclause is intended to be read together with subclause 7.3.4.7 "Examples of GTP' messaging cases". The normal communication would be GSN sending Data Record Packets to a CGF, which answers with "Request Accepted" responses. Under normal condition the CDR transmission uses a Request-Response messaging sequence in the GSN to CGF GTP' protocol communication.

Sometimes a non-PDP context related CDR (e.g. M-CDRs) is transmitted, and thus the GGSN does not pass the CGF address information to the SGSN. The SGSN will in this case direct the CDRs to the current default CGF for the SGSN. This is the configured Primary CGF address, or if that CGF is out of service, then the secondary CGF address etc.

Summary of the CGF redundancy mechanism, that prevents duplicated CDR packets to enter the BS, is described below. This, or other mechanisms are deployed to enhance the reliability of CDR transport.

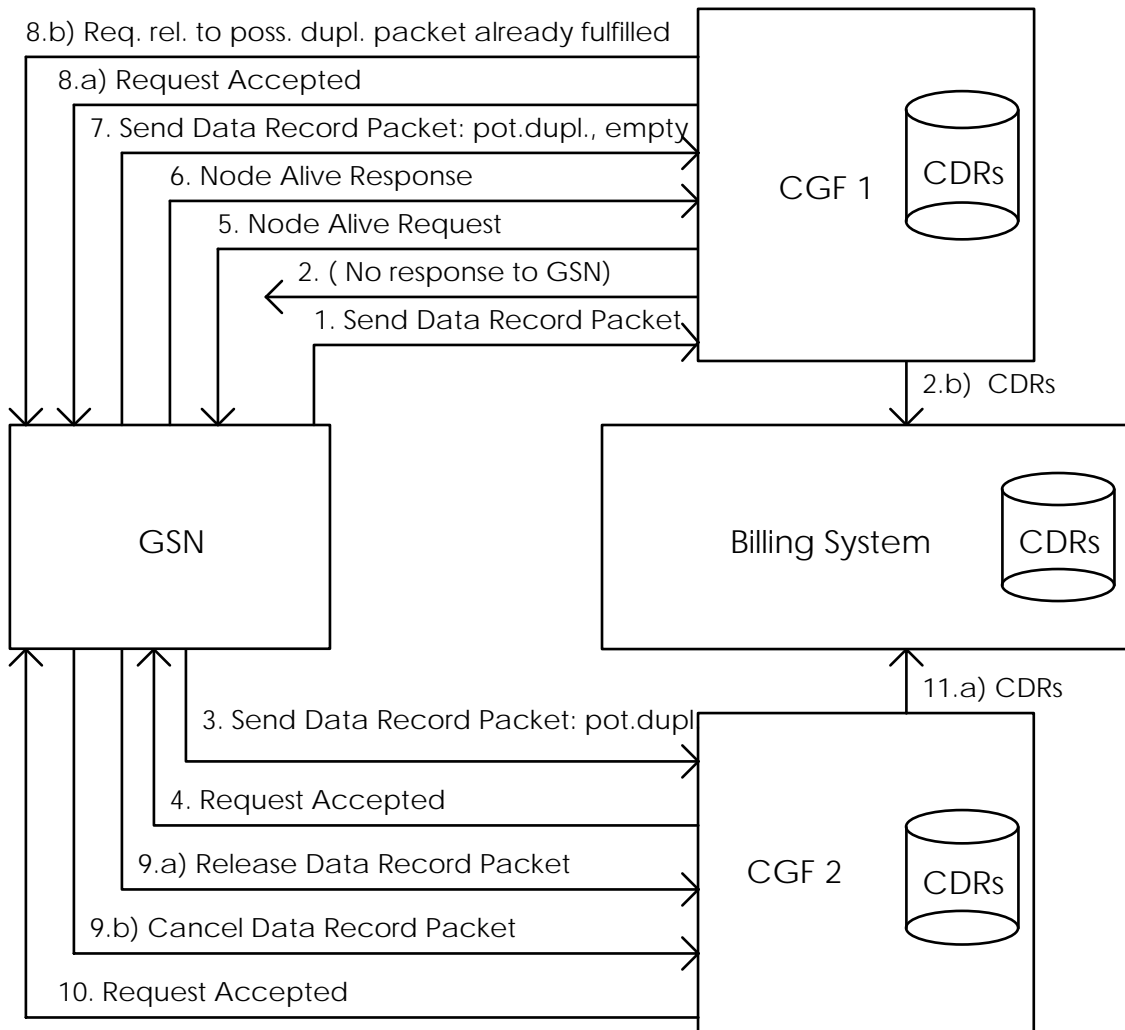

The general logic of the duplicate CDR packet prevention in CGF redundancy cases is shown in Figure 11, where the messages are numbered sequentially, alternative messages are indicated by an index character ('a' or 'b') that follows the arrow sequence number. The main mechanism of the messaging in CGF redundancy cases (when a GSN-CGF link is down or a CGF is not working) is based on GSN (1) first trying to send a CDR packet to CGF1. In case no acknowledgement or a successful response is received (2) from CGF1 due to any reason, e.g. such as the request not reaching CGF1 despite repeated attempts (or the responses from CGF1 to the GSN are lost after the CGF1 has either stored it securely, or, forwarded it towards post-processing (2b)), the unacknowledged CDR packets are redirected to CGF2. The invocation for a re-transmission may be triggered by a time-out mechanism.

The GSN may first test the GSN-CGF2 link by sending an 'Echo Request' message to CGF2, in response to which CGF2 would respond with the 'Echo Response' message. The CDR packets not successfully received by the primary CGF (=CGF1) are sent to CGF2 (3), and are marked as potential duplicates, and CGF2 responds to the request(s) (4). Such CDRs, i.e. CDRs that are marked as potential duplicates would wait there for further commands from GSN.

When the GSN detects (5) & (6) that the primary CGF, in this case CGF1 is again able to communicate with it on receiving *Node Alive Request* (or getting a *Echo Response* from CGF2 to a *Echo Request* sent by the GSN) it answers by *Node Alive Respond*. Then the GSN tests CGF1 with an empty packet (7), retrying continuously if no response is received, using e.g. increasing timeouts (using the old unacknowledged packet's Sequence Number, if the CGF1 would consider the packet to be a new one (8a) or an already received one (8b)). According to the response received from CGF1, the GSN gives the CGF2 a command to either release (9a) or cancel (9b) the corresponding CDR packet from CGF2. CGF2 then confirms the decision (10), and is able to send the CDRs towards the BS (11a).

**Error handling:** By default, retransmissions after configurable timeouts are used. If after the CGF1 communication failure, the CDR packet sending from GSN to CGF2 does not succeed, the GSN tries to use CGF3 as the intermediate CDR packet storage entity, etc. If no acknowledgement (10) is received by the GSN for its message(s) (9a) or (9b), the GSN will retransmit the message (9a) or (9b) continuously and persistently, using e.g. increasing time intervals. An alarm should be sent to the O&M system if a communication link goes down. It shall be possible to release/cancel CDR packets from CGFs and unacknowledged sequence numbers from GSNs by O&M operations if permanent GSN-CGF link failures would occur. The buffers containing the Sequence Numbers of potentially duplicated packets, and the buffers containing the numbers of unacknowledged CDR packets shall be kept up to date (with CDR packet transfers) using transaction mechanisms. In the case of the GSN-CGF1 communication link being down, any new CDRs generated by the GSN are sent to a properly working CGF2, instead of the CGF1.

**Figure 11: General CGF redundancy messaging scheme**

**A more detailed description of the CGF redundancy mechanism:**

Due to a network failure / network congestion or a temporary node failure, a CGF might not be able to send a response within the configured timeout period to a request it got from a GSN. As a first attempt, retries of requests are to be used as defined in 3GPP TS 29.060 [8], if the response is not received in the configured time.

If a CDR generating node loses its connection to the CGF unexpectedly, it may send the CDRs to the next CGF in the priority list. If the CGF changes, the GSN can continue sending CDRs to different CGF nodes, depending on which CGF has been configured as the receiver of CDRs for a particular PDP context.

**Sequence number buffers:** The GSN might lose its connection to its primary CGF due to a link failure or CGF going down. In this kind of redundancy condition the GSN attempts to redirect the CDR traffic to a secondary CGF (after possible retries have failed). The GSN maintains an internal buffer for Sequence Numbers of requests not yet successfully responded to by the primary CGF, for the case that it may become capable of communicating to the primary CGF at a later date. The GSN will send the not responded Data Record Packets (DRPs) to the secondary CGF, and the GSN maintains also a buffer for the Sequence Numbers related to those DRPs that have been temporarily stored to this secondary CGF. (If the communication towards the secondary CGF would not work, the transfer of possibly duplicated DRPs and Sequence Number bookkeeping would be done for a tertiary CGF etc.) Also the CGFs maintain Sequence Number buffers for each of their GSN links. The Sequence Numbers may in future be needed in relation to the possibly duplicated CDRs that the CGFs have got from the GSN(s). The Sequence Numbers are stored to wait for a final decision to release them towards the BS (if the primary CGF had not received successfully the packets originally sent by a GSN) or to cancel them (if the primary CGF had received and processed successfully the originally by GSN sent packets).

The GSN is able to instruct CGF2 to cancel (or instruct CGF2 to transfer towards the BS), the CDR packets sent to a secondary CGF if the primary CGF becomes available for service. To make the right decision the GSN first sends an empty test packet with the ‘Send possibly duplicated Data Record Packet’ Packet Transfer Command to the primary CGF, using a previously not responded Sequence Number.

In case that the empty test packet to the primary CGF (which was temporarily down (or to which the link was down)) is responded with the **Cause** value "Request Accepted", the GSN will release the corresponding CDRs waiting for final decision in the secondary CGF, towards the Billing System (BS) with the Packet Transfer Command ‘Release Data Record Packet’.

If the primary CGF responses this test message with the **Cause** value "Request related to possibly duplicated packets already fulfilled", the GSN will cancel the corresponding CDRs waiting for final decision in the secondary CGF, using the Packet Transfer Command ‘Cancel Data Record Packet’.

To enable that a GSN failure (destroying its Sequence Number buffers per each CGF link for non-responded requests or possibly duplicated packets) would not cause CDR packets to stay forever in the temporary decision waiting buffers of CGFs, there should also be O&M means of emptying those CGF buffers.

There shall also be a configurable parameter in the CGF for making the final decision, as to whether or not it is able to send the CDRs to the Billing System (BS) for the case where the backup buffering mechanism in the GSN could not be used until the end of the messaging sequence related to a certain CDR packet has been completed. This way the operator can:

- A) Select that the GSNs and CGFs take care of duplicate prevention and the BS is not required to do duplicate checking due to possible duplicates caused by Network Element or CGF redundancy mechanisms.
- B) Select that the BS performs the duplicate prevention. To do this in the most effective way, the CGF may include an additional flag linked to possibly duplicated CDRs sent to the Billing System, indicating that they have not been released by a GSN for BS use (or use special kind of file name if a file protocol is used between CGF and BS). This means that the BS has somewhat more processing work to do, but the BS would anyway get a duplicate free end result. CGF is in this case always authorised to forward CDRs towards the BS, also when they contain possibly duplicated data. For this case the CGFs may also have a configurable flag that *Data Record Packet Cancel/Release* operations are not needed.

#### 7.3.4.5.2 Information Elements in Data Record Transfer Request

The Information Elements in *Data Record Transfer Request* message is specified in Table 13.

**Table 13: Information Elements in a Data Record Transfer Request**

Information Element	Presence requirement
Packet Transfer Command	Mandatory
Data Record Packet	Conditional
Sequence Numbers of Released Packets	Conditional
Sequence Numbers of Cancelled Packets	Conditional
Private Extension	Optional

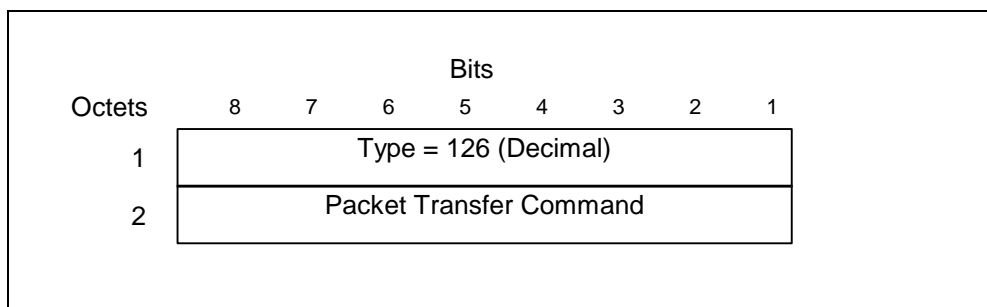

#### 7.3.4.5.3 Packet Transfer Command IE

The value of the Packet Transfer Command in its Information Element tells the nature of the message:

- 1 = ‘Send Data Record Packet’;
- 2 = ‘Send possibly duplicated Data Record Packet’;
- 3 = ‘Cancel Data Record Packet’;
- 4 = ‘Release Data Record Packet’.

The following describes the usage of each Packet Transfer Command. The first command is for normal CDR transfer while the other values are only used as part of the redundancy mechanism.

- 1) **Send Data Record Packet.** This is the usual command used for sending CDRs under normal conditions when no error recovery is needed or the redirection mechanism is not involved. It is shown in Figure 12. The other three commands are being used only in error recovery cases. Out of the three conditional IEs shown in Table 13, only the "Data Record Packet" is present in this message.
- 2) **Send possibly duplicated Data Record Packet.** When the CDR packet is redirected to a secondary CGF (by a CDR generating node) because the currently used CGF is not working or the CDR transfer is not working properly, or if there is an error in the link between the CDR generating node and the CGF, then this Packet Transfer Command is used instead of the normal 'Send Data Record Packet'. Of the conditional IEs, the "Data Record Packet" is present in the message, when sending the message to a CGF acting as temporary storage, when the original primary CGF could not be contacted. This Packet Transfer Command is used also when sending "empty" test packets with older (but not yet acknowledged) sequence numbers after a peer node or link recovery, to check if the CGF had received some Data Record Packets (whose acknowledgement did not come to the *Data Record Packet* sending node) before the link to the recipient node became inoperable.
- 3) **Cancel Data Record Packet.** Of the conditional IEs, the "Sequence Numbers of Cancelled Packets" is present in the message.
- 4) **Release Data Record Packet.** Of the conditional IEs, the "Sequence Numbers of Released Packets" is present in the message.

**Figure 12: Packet Transfer Command information element**

After the CGF has received the *Packet Transfer Command* 'Release Data Record Packet' with the Sequence Number(s) for earlier sent 'Send possibly duplicated Data Record Packet' command(s), it can consider itself authorised to send the *Data Record Packets* previously marked as possibly duplicated towards the Billing System (BS) as normal (not duplicated) CDRs.

#### 7.3.4.5.4 Data Record Packet IE

The *Data Record Packet* element, which is present conditionally if the Packet Transfer Command is 'Send Data Record Packet', may contain one or more data records. This is illustrated in Figure 13. If an "empty packet" is to be sent, then the *Data Record Packet* IE contains only the *Type* (with value 252 in decimal) and the *Length* (with value 0) fields. The format of the records is ASN.1 or another format, identified by the *Data Record Format*.

In order to uniquely identify the *Data Record Format Version* for an ASN.1 encoded CDR, the following procedure is recommended:

The two octets that represent the *Data Record Format Version* (Octets # 6 and 7 of the IE, shown in Figure 13) are defined by the following numbers in the 'DataTypes' field: The first octet (i.e., #6) is derived from the number of the corresponding 3GPP TS and the second octet (i.e., #7) is the version number. Since an octet can only represent a number less than 255, it is necessary to correlate the TS document number with an agreed upon key. The following is recommended:

- \* For R98 documents (e.g., from GSM 12.15 or TS 10g1 393), '0' is used.
- \* For R99 documents (e.g., TS 32.015) '1' is used.
- \* For R4 (e.g., TS 32.215) '2' is used.

For example, in this document (R4) the ‘DataTypes’ is defined in section 6.1 as:

```
TS32215-DataTypes {itu-t (0) identified-organization (4) etsi (0) mobileDomain (0) umts-Operation-
Maintenance (3) ts-32-215 (215) informationModel (0) asn1Module (2) version1 (1)}
```

Therefore, for an R4 CDR defined by this document, the two numbers placed in the two octets of the *Data Record Format Version* field are 2 (the first digit of 215, for ‘ts-32-215’) and 1 for ‘version1’. Octet #6 of the *Data Record Packet IE* and octet #7 would contain the numbers 2 and 1, respectively.

For an R99 CDR, the TS 32.015 ‘DataTypes’ is defined in [12] as:

```
GPRS-Charging-DataTypes {ccitt (0) identified-organization (4) etsi (0) mobileDomain (0) umts-
Operation-Maintenance (3) ts-32-015 (15) informationModel (0) asn1Module (2) version1 (1)}
```

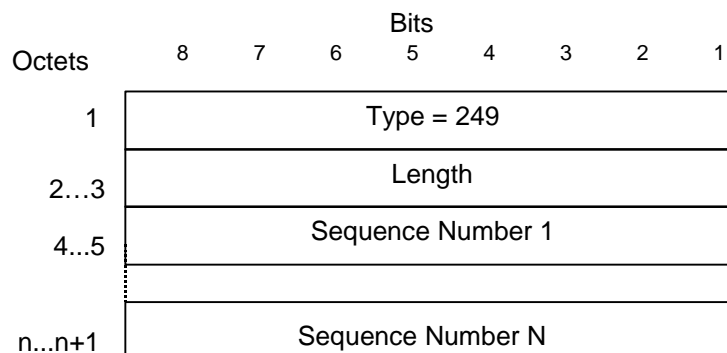

For this CDR, the two numbers placed in the two octets of the *Data Record Format Version* field are 1 and 1.

**Figure 13: Data Record Packet information element**

#### 7.3.4.5.5 Sequence Numbers of Released Packets IE

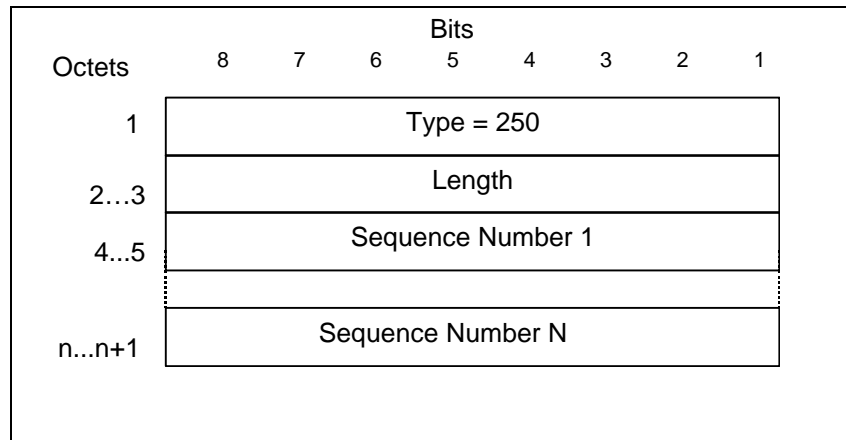

The *Sequence Numbers of Released Packets* is present if the *Packet Transfer Command* is ‘Cancel Data Record Packet’. The format of the Information Element is described in Figure 14 below:

**Figure 14: Sequence Numbers of Released Packets information element**

### 7.3.4.5.6 Sequence Numbers of Cancelled Packets IE

The *Sequence Numbers of Cancelled Packets* information element is shown in Figure 15 and contains the IE *Type*, *Length* and the *Sequence Number(s)* (each 2 octets) of the cancelled *Data Record Transfer Request(s)*. It is present if the *Packet Transfer Command* is 'Cancel Data Record Packet'.

**Figure 15: Sequence Numbers of Cancelled Packets information element**

### 7.3.4.5.7 Private Extension IE

The optional *Private Extension* contains vendor or operator specific information.

### 7.3.4.6 Data Record Transfer Response

The message shall be sent as a response of a received *Data Record Transfer Request*. Also, several *Data Record Transfer Requests* can be responded by a single *Data Record Transfer Response*.

**Table 14: Information Elements in a Data Record Transfer Response**

Information Element	Presence requirement
Cause	Mandatory
Requests Responded	Mandatory
Private Extension	Optional

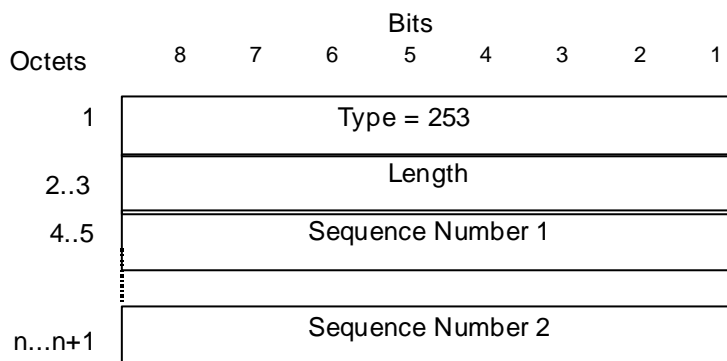

The **Cause** value is the same (whatever the value) for all those messages responded by that particular Response.

Possible **Cause** values are:

- "Request Accepted";
- "No resources available";
- "Service not supported";
- "System failure";
- "Mandatory IE incorrect";
- "Mandatory IE missing";
- "Optional IE incorrect";
- "Invalid message format";
- "Version not supported";
- "Request not fulfilled";
- "CDR decoding error";
- "Request already fulfilled";
- "Request related to possibly duplicated packet already fulfilled".

The **cause** value "CDR decoding error" is optional, primarily intended to inform the CDR generating node that the receiving node can not decode the CDR. Thus, special features in the receiving node that are based on information within the CDR would not be operable. This message could alert the operator of a remote generating node of incompatible CDR encoding. It is Optional and no action or response is required.

The Requests Responded information element contains the IE *Type*, *Length* and the *Sequence Numbers* (each 2 octets) of the *Data Record Transfer Requests*. It is shown in Figure 16.

**Figure 16: Requests Responded information element**

The optional *Private Extension* contains vendor or operator specific information.

Depending on the **Cause** value severity and general occurrence frequency, the node that sent the corresponding *Data Record Transfer Request*, may start to direct its CDRs to another CGF.

#### 7.3.4.7 Examples of GTP' messaging cases

The following example cases represent the three different key *Data Record Transfer Request/Response* messaging related CDR packet handling schemes. Cases 2 and 3 represent situations involving the redundancy mechanism.

Case 1): The normal CDR packet transfer:

GSN sends successfully a CDR packet to the CGF, and since the GSN gets a response (Request Accepted) for the Data Record Transfer Request, there is no need to revert to the CGF redundancy mechanism and redirect the CDR packet traffic flow to an other CGF.

Case 2) : The GSN-CGF1 connection breaks before a successful CDR reception:

In this example case the CDR packet sent by the GSN is lost before it is received by the CGF1. (The loss might be caused by a link failure or e.g. a major CGF1 failure.)

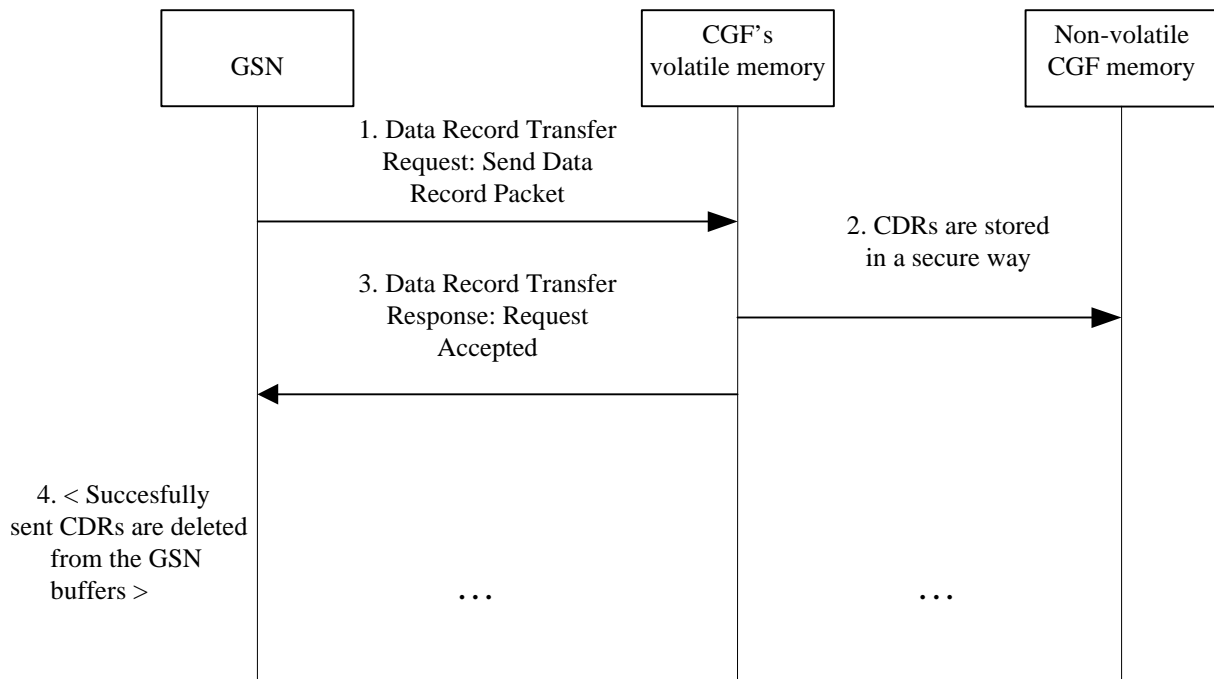

Case 3): The GSN-CGF1 connection breaks after a successful CDR reception:

In this example case the CDR packet sent by the GSN is received correctly by the CGF1 and moved to its non-volatile memory (or even to the next NE in the communication chain). Anyhow, the GSN-CGF1 communication stops working, in this example case, before the GSN gets the positive response (Data Record Transfer Response: Request Accepted) that would acknowledge that the CDR packet was successfully received by CGF1.

The next three subclauses describe in more detail each of these key *Data Record Transfer Request/Response* messaging schemes.

### 7.3.4.7.1 Case 1: The normal CDR packet transfer

Figure 17 represents the default mode of CDR transfer from the CDR generating entities (GSNs) to the CDR packet collecting entities (CGFs).

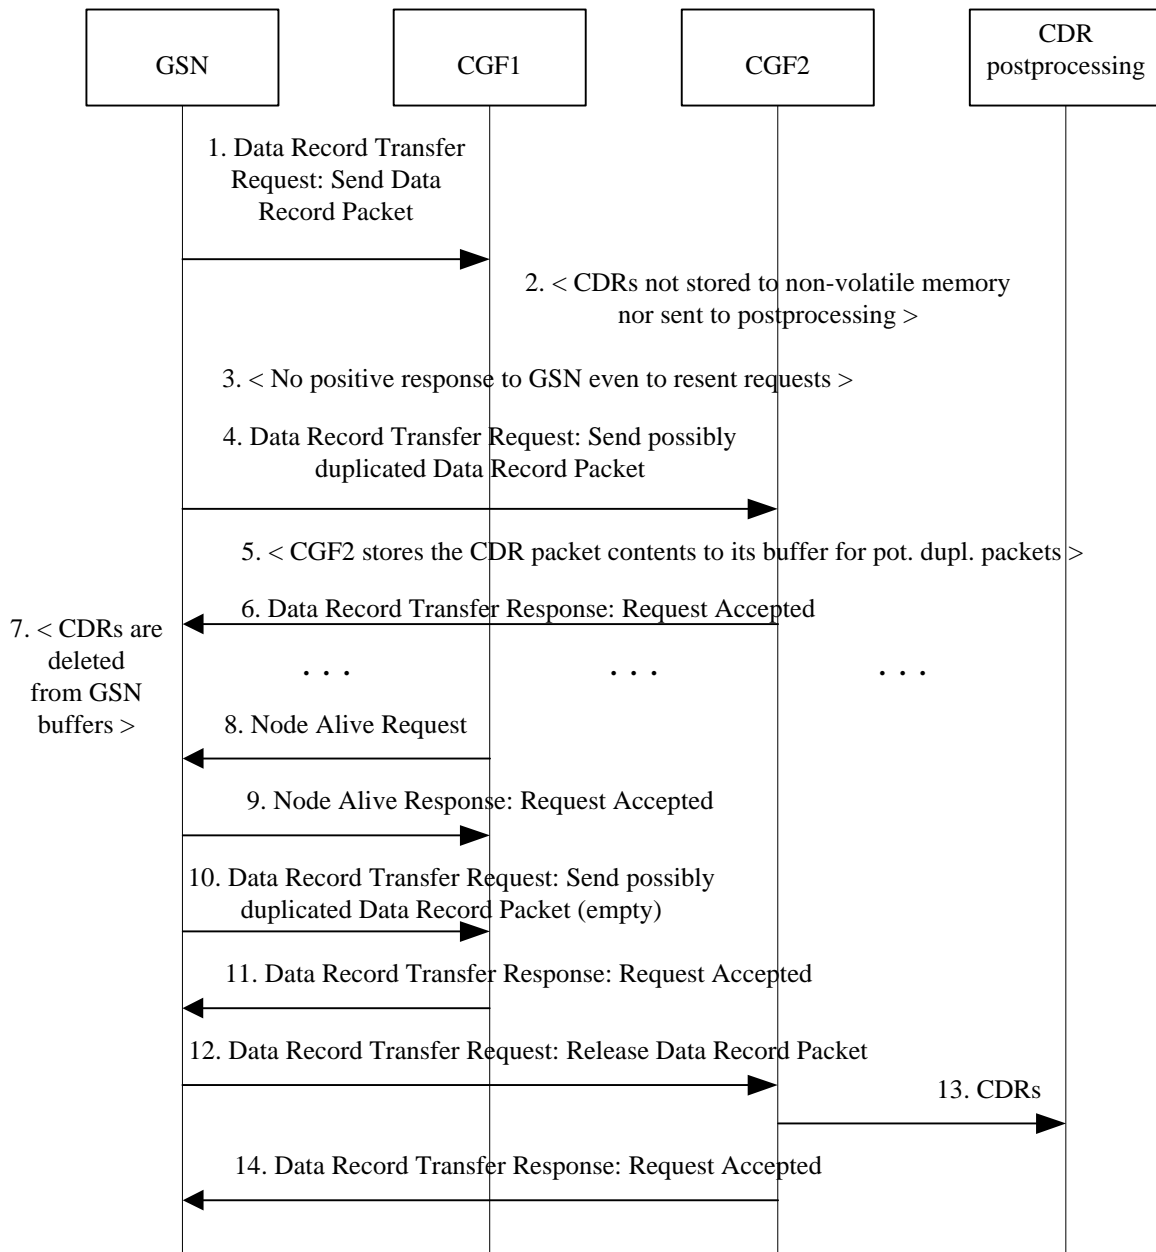

**Figure 17: A normal CDR transfer process between a GSN and CGF**

- 1) The CDR generating entity (here the GSN symbolises either SGSN or GGSN) sends CDR(s) in a packet to CGF (that is the current primary Charging Gateway Functionality for the specific CDR generating node, "CGF1"). The sending is performed by using the Data Record Transfer Request message, with the *Packet Transfer Command IE* having the value 'Send Data Record Packet'.
- 2) The CGF opens the received message and stores the packet contents in a safe way (to e.g. a redundant RAM memory unit or a mirrored non-volatile memory or even to another node).
- 3) The CDR receiving entity (CGF) sends confirmation of the successful packet reception to the CDR generating node (GSN). The confirmation is performed by using the *Data Record Transfer Response* message, with the **Cause** value being 'Request Accepted'.
- 4) After the positive response 'Request Accepted' is received by the GSN, it may delete the successfully sent CDRs from its send buffer.

The general principle of GTP' to retransmit the request if the response has not been received within a configurable time-out limit, is also followed here in point 1). The maximum amount of retries is a configurable value.

### 7.3.4.7.2 Case 2: The GSN-CGF1 connection breaks before a successful CDR reception

Figure 18 describes the exceptional case when the CDR transfer from a CDR generating entity (GSN) to the primary CDR packet collecting entity (CGF1) fails in a way that the CGF1 is not able to store the CDR packet sent by the GSN. (The reason for the failure in packet transfer may be e.g. a link failure between the GSN and CGF1, or a capacity exhausting error in the storage device of CGF1, or a general CGF1 system failure or CGF1 maintenance break.)

**Figure 18: Duplicate prevention case: CDR sending via CGF1 had not succeeded**

- 1) The CDR generating entity (GSN) sends CDR(s) in a packet to CGF (that is, the current primary CGF for the specific CDR generating node, "CGF1"). The sending is performed by using the *Data Record Transfer Request* message, with the *Packet Transfer Command* IE having the value 'Send Data Record Packet'.
- 2) Due to a failure in the GSN-CGF1 communication link of CGF1, the CGF1 is not able to store the packet sent by the GSN in a safe way (to e.g. a redundant RAM memory unit or a mirrored non-volatile memory or to another node).
- 3) Therefore the GSN is not able to get a response (or it could alternatively get a negative response like "No resources available" as the **Cause** value in the *Data Record Transfer Response* message).
- 4) The GSN may now first test the GSN-CGF2 link by an Echo Request message that the CGF2 would respond by the Echo Response.) Then, the GSN sends the same CDR packet that could not be sent to CGF1 to the next CGF in its CGF preference list (here CGF2) using the *Data Record Transfer Request* message, with the *Packet Transfer Command* IE having the value 'Send possible duplicated Data Record Packet'.

- 5) As the connection to the CGF2 is working, the CGF2 is able to process the CDR packet. Since the packet was marked by the sending GSN to be potentially duplicated, it is stored into the CGF2, but not yet sent forward towards the Billing System.
- 6) The CGF2 sends confirmation of the successful packet reception to the GSN. The confirmation is performed by using the *Data Record Transfer Response* message, with the **Cause** value being 'Request Accepted'
- 7) The GSN can now delete the now successfully sent (potentially duplicated) CDRs from its CDR buffer (but it keeps the sequence number(s) of the sent potentially duplicated packet(s) in a buffer dedicated for that.
- 8) When CGF1 is recovering after a system reboot, it sends a *Node Alive Request* message to the configured peer GSN(s), and so the GSN notices that it can again successfully communicate with the CGF1. (The GSN may also detect this by using the *Echo Request* messages, which would be answered by CGF1 by the *Echo Response* message.)
- 9) GSN acknowledges the CGF1 by *Node Alive Response* message.
- 10) For the earlier unacknowledged *Data Record Transfer Request* message(s), the GSN sends CGF1 empty test packet(s) (with no CDR payload in the Data Record Packet IE but just the other parts of the message frame).
- 11) CGF1 responds with *Data Record Transfer Response* message, with the **Cause** value being 'Request Accepted', because in this example case CGF1 had lost the communication capability towards GSN before storing the previously received (and by CGF1 unacknowledged) CDR packet.
- 12) Now GSN knows that the CGF1 had not originally been able to process and forward the original version of the CDR packet from the GSN, and it indicates CGF2 that CGF2 can send the CDR packet(s) related to the previously unacknowledged GTP' *Sequence Number(s)* to post-processing. Those packets' *Sequence Numbers* are indicated in the *Sequence Numbers of the Released Packets* IE.
- 13) CGF2 shall now be able to send the released packets towards post-processing.
- 14) CGF2 responds with *Data Record Transfer Response* message, with the **Cause** value being 'Request Accepted'.

After all the potentially duplicated packets are cleared from CGF(s), the GSN can continue in normal way the transfer of CDRs.

### 7.3.4.7.3 Case 3: The GSN-CGF1 connection breaks after a successful CDR reception

**Figure 19: Duplicate prevention case: CDR sending via CGF1 had succeeded**

- 1) The CDR generating entity (GSN) sends CDR(s) in a packet to CGF (that is the current primary Charging Gateway Functionality for the specific CDR generating node, "CGF1"). The sending is performed by using the *Data Record Transfer Request* message, with the *Packet Transfer Command* IE having the value 'Send Data Record Packet'.
- 2) The CGF1 is able to store the packet sent by the GSN in a safe way (to e.g. a redundant RAM memory unit or a mirrored non-volatile memory or to another node).

- 3) Since the GSN-CGF1 communication connection is now broken, the GSN is not able to get the response "Request Accepted" as the **Cause** value in the *Data Record Transfer Response* message.
- 4) Then the GSN sends the same CDR packet that could not be sent to CGF1 to the next CGF in its CGF preference list (here CGF2) a *Data Record Transfer Request* message, with the *Packet Transfer Command* IE having the value 'Send possible duplicated Data Record Packet'. (That sending may be preceded by the testing of the GSN-CGF2 link by an *Echo Request* message, that the CGF2 would respond by the *Echo Response*.)
- 5) As the connection to CGF2 is working, CGF2 is able to process the CDR packet. Since the packet was marked by the sending GSN to be potentially duplicated, it is stored in CGF2, but not yet sent forward towards the post processing or Billing System.
- 6) The CGF2 sends confirmation of the successful packet reception to the GSN. The confirmation is performed by using the *Data Record Transfer Response* message, with the **Cause** value being 'Request Accepted'
- 7) The GSN can now delete the now successfully sent (potentially duplicated) CDRs from its CDR buffer (but it keeps the sequence number(s) of the sent potentially duplicated packet(s) in a buffer dedicated for that.
- 8) When CGF1 is recovering after a system reboot, it sends a *Node Alive Request* message to the configured peer GSN(s), and so the GSN notices that it can again successfully communicate with the CGF1. (The GSN may also detect this by using the *Echo Request* messages, which would be answered by CGF1 by the *Echo Response* message.)
- 9) GSN acknowledges the CGF1 by *Node Alive Response* message.
- 10) For the earlier unacknowledged *Data Record Transfer Request* message(s), the GSN sends CGF1 empty test packet(s) (with no CDR payload in the *Data Record Packet* IE but just the other parts of the message frame).
- 11) CGF1 responds with *Data Record Transfer Response* message, with the **Cause** value being 'Request related to possibly duplicated packets already fulfilled', because in this example case CGF1 had lost the communication capability towards GSN after storing the previously received (and by CGF1 unacknowledged) CDR packet.
- 12) Now GSN knows that the CGF1 had originally been able to process and forward the original version of the CDR packet from the GSN, and it indicates CGF2 that CGF2 can cancel the CDR packet(s) related to the previously unacknowledged GTP' GSN-CGF1 Sequence Number(s). Those packets' *Sequence Numbers* are indicated in the *Sequence Numbers of the Cancelled Packets* IE.
- 13) CGF2 shall now delete the cancelled packet(s) from its buffer for potentially duplicated packets.
- 14) CGF2 responds with *Data Record Transfer Response* message, with the **Cause** value being 'Request Accepted'.

After all the potentially duplicated packets are cleared from CGF(s), the GSN can continue in normal way the transfer of CDRs.

## 7.4 Data Record Formats used in GTP'

The format of the CDRs sent between the UMTS Network Elements that generate the PS domain CDRs and the CGF are defined by the *Data Record Format of Data Record Packet* information element.

### 7.4.1 ASN.1 format

See clause 6 and the ASN.1 language descriptions for the definitions. Basic Encoding Rules (BER) provides the transfer syntax for abstract syntax defined in ASN.1.

### 7.4.2 Other formats

The physical CDR format can also be a private one. The *Data Record Format identifiers* 11...50 (decimal) are reserved for private (implementation specific) use.

## 7.5 CGF - BS Protocol Interface

### 7.5.1 The transfer protocols at CGF - BS interface

The present document gives several recommendations for the main protocol layers for the Charging Gateway Functionality - Billing System (BS) interface protocol stack. These recommendations are not strictly specified features, since there are a lot of variations among the existing Billing Systems. The recommendations are FTAM protocol over X.25 or TCP/IP, and FTP over TCP/IP.

### 7.5.2 The format of the CDRs at CGF - BS interface

The contents of the CDRs sent between the CGF and the Billing System (BS) are defined by the ASN.1 language clause 6, Charging Data Record Structure. In addition, other CDR contents or formats are possible if the CGF provides processing functionality for the CDRs.

---

## Annex A (Normative): Charging Characteristics

Charging Characteristics can be supplied by the HLR to the SGSN as part of the subscription information. A subscriber may have charging characteristics assigned to his subscription and/or his subscribed APNs. The SGSN applies a preconfigured default if no charging characteristics are supplied by the HLR. The SGSN shall support three different charging characteristics default configurations:

- \* the home default profile for subscribers of the SGSN's PLMN;
- \* the visiting default profile for visitors using a GGSN belonging to the same PLMN as the SGSN;
- \* the roaming default profile for visitors using a GGSN belonging to their home PLMN.

The SGSN can determine the GGSN PLMN from the operator identifier part of the APN. Optionally the SGSN may support several visiting and roaming default profiles based on the MNC/MCC combination of the subscriber.

In the case of a home subscriber, the charging characteristics are selected by the SGSN according to the following procedures. For PDP context specific charging characteristics (i.e. those used for the S-CDRs that are generated for this PDP context):

- ◆ If the MS requests a particular APN then
  - \* If the SGSN accepts this request (i.e. it has been verified against the subscription) then
    - If it has been matched against the wildcard APN then
      - If charging characteristics for the wildcard APN are present in the subscription information then they shall be used;
      - If no charging characteristics are present for the wildcard APN but subscription related charging characteristics are present, then they shall be chosen;
      - If neither of the two are present then the SGSN home default shall be applied.
    - If it has been matched against a specific subscribed APN then
      - If charging characteristics for this APN are present in the subscription information then they shall be used;
      - If no charging characteristics are present for the APN but subscription related charging characteristics are present, then they shall be chosen;
      - If neither of the two are present then the SGSN home default shall be applied.
  - \* If the SGSN rejects the request then charging characteristics selection does not apply.
- ◆ If the MS does not request an APN then
  - \* If the SGSN chooses a subscribed APN then
    - If charging characteristics for this APN are present in the subscription information then they shall be used;
    - If no charging characteristics are present for the APN but subscription related charging characteristics are present, then they shall be chosen;
    - If neither of the two are present then the SGSN home default shall be applied.
  - \* If only the wildcard APN is present in the subscription, i.e. the SGSN applies its configured default APN then
    - If charging characteristics for the wildcard APN are present in the subscription information then they shall be used;
    - If no charging characteristics are present for the wildcard APN but subscription related charging characteristics are present, then they shall be chosen;

- If neither of the two are present then the SGSN home default shall be applied.

For the non-PDP context specific CDR types, i.e. the M-CDRs and the SMS CDRs, the SGSN applies the subscription specific charging characteristics, or, if not supplied, it shall choose the home default profile as defined above.

In case of subscribers from other PLMNs, the SGSN may be configured to either apply the “home subscriber case” charging characteristics selection procedure defined above, or to ignore charging characteristics provided by the subscriber’s HLR, and apply a default configuration instead. If default charging characteristics are selected for the foreign subscriber, then the SGSN shall choose either the visiting or roaming default profile for the PDP context specific charging characteristics, according to the roaming or visiting scenario, as described above. For M-CDRs and SMS CDRs, the operator can configure if the roaming or the visiting profile shall be applied, since no GGSN is involved.

Upon activation of a PDP context, the SGSN forwards the charging characteristics to the GGSN according to the following rules:

- \* if charging characteristics were received from the HLR, then they shall be sent as provided by the HLR, regardless of the home, visiting, or roaming case, and regardless of whether the SGSN applies the HLR supplied charging characteristics or chooses to ignore them;
- \* if no charging characteristics were received from the HLR, then the SGSN does not forward any charging characteristics to the GGSN.

The above procedure implies that no explicit transfer of the Charging Characteristics Selection Mode (see 3GPP TS 23.060) to the GGSN is necessary, because it is implicitly given as “subscribed” when the GGSN receives charging characteristics from the SGSN, and “non-subscribed” otherwise.

The GGSN shall also apply charging characteristics to its PDP contexts. It shall either apply the SGSN supplied parameters, or it may be configured to ignore the SGSN supplied charging characteristics in any combination of the following cases:

- \* visiting case, i.e. the subscriber belongs to a different PLMN;
- \* roaming case, i.e. the SGSN belongs to a different PLMN;
- \* home case, i.e. the subscriber belongs to the same PLMN as the GGSN; or
- \* unconditionally, i.e. it always ignores the SGSN supplied parameters.

If the GGSN ignores the parameters supplied by the SGSN, it shall nevertheless accept the PDP context request. It shall then apply its own preconfigured charging characteristics as appropriate, i.e. the home, visiting or roaming profile. The GGSN shall support the configuration of one set of default charging characteristics (i.e. home, visiting, roaming) for each of its supported APNs.

Charging Characteristics consists of a string of 16 bits designated as Profile (P) and Behaviour (B), shown in Figure 4. The first four bits (P) shall be used to select different charging trigger profiles, where each profile consists of the following trigger sets:

- \* **S-CDR:** activate/deactivate CDRs, time limit, volume limit, maximum number of charging conditions, tariff times;
- \* **G-CDR:** same as SGSN, plus maximum number of SGSN changes;
- \* **M-CDR:** activate/deactivate CDRs, time limit, and maximum number of mobility changes;
- \* **SMS-MO-CDR:** activate/deactivate CDRs;
- \* **SMS-MT-CDR:** active/deactivate CDRs.

In addition to these trigger sets, the profile may also specify an optional charging gateway address. If this CGF address is configured in the GGSN’s selected trigger profile, the GGSN shall apply it for the G-CDRs and send this charging gateway address in its GTP message exchange with the SGSN (overriding any other GGSN configured CGF address). In the home or visiting case, the SGSN shall apply the received CGF address to the S-CDRs pertaining to this PDP context. In the roaming case, or if no address is received from the GGSN, then the SGSN shall use the CGF address from its own selected charging characteristics trigger profile, or, if it does not exist, use the default CGF address. For M-CDRs and SMS CDRs, the SGSN shall use the CGF address configured in the charging characteristics that it applies to the respective CDRs, or if no such address is configured then the default CGF shall be used.

The Table below is an informative example intended for clarification.

**Table 15: Example of Charging Characteristics Profiles**

Profile Index bits 0 - 3	CGF Address	S-CDR					G-CDR	
		Active	Time limit	Volume limit	Change cond	Tariff times	Active	...
0	-	Yes	30 min	100 K	2	0-7, 7-12, ...		
1	100.128.35 .20	No	-	-	-	-		
2	-	Yes	10 min	50 K	1	0-24		
..	..	..	..	..	..	..		

The remaining 12 (B) bits can be freely assigned to particular charging behaviours that the GSNs support. Examples of those behaviours are:

- \* Selection of the applicable idle context purge timer, i.e. use global value or use special value. This feature could be used to distinguish between customers and/or APNs whose PDP contexts should be purged after short (e.g. 30 minutes) or long (e.g. 12 hours) periods of inactivity.
- \* Use specific charging gateway address (override all other configured/selected CG addresses).
- \* Deactivate SMS-MO-CDRs for customers of the own PLMN using preconfigured SMSC addresses.
- \* Disable G-CDRs for roamers that use the HPLMN GGSN.
- \* Allow or inhibit the use of own GGSNs by visitors.
- \* Allow or inhibit network triggered QoS change (upgrade and/or downgrade).
- \*

The SGSN selects the charging characteristics for M-CDR generation upon the creation of a MM context. Both SGSN and GGSN select the charging characteristics for PDP context CDR generation (i.e. S-CDR and G-CDR, respectively) upon creation of a PDP context or secondary PDP context. Once selected, the charging characteristics shall be maintained throughout the lifetime of the MM or PDP contexts. If the SGSN receives modified subscriber information from the HLR (e.g. execution of a stand-alone Insert Subscriber Data procedure) which includes changes to the charging characteristics, they shall be applied only to new MM, PDP and secondary PDP contexts, this implies that the SGSN shall not send PDP context modifications for the existing PDP contexts to the GGSN.

## Foreword

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP). The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

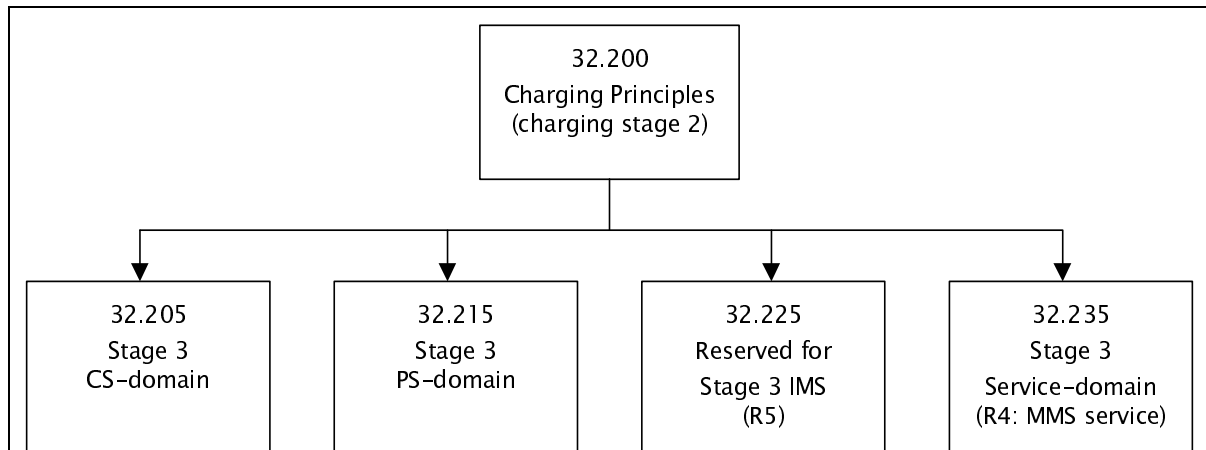

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

---

# 1 Scope

This document is part of a series of documents specifying charging functionality in UMTS network with application services. The UMTS core network charging principles are specified in document TS 32.200 [2], which provides an umbrella for other charging documents that specify the structure and content of the CDRs and the interface protocol that is used to transfer them to the collecting node. The document structure is defined in figure 1. The CDR content and transport for application services are described in the present document especially for MMS. As the basis and reference for this work is taken the functional description of the MMS specified for stage 1 in TS 22.140[3] and stage 2 in TS 23.140[4].

**Figure 1 Charging Document Structure**

All references, abbreviations, definitions, descriptions, principles and requirements that are common are defined in the 3GPP Vocabulary [1] and specialised to charging in UMTS domains or subsystems are provided in the umbrella document [2].

## 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the following terms and definitions apply in addition to those defined in 3GPP TR 21.905 [1] and 3GPP TS 22.140 [3]:

**MMSE:** A collection of MMS-specific elements under the control of a single administration.

**MMS Relay/Server:** An MMS-specific network entity/application that is under the control of an MMS service provider. An MMS Relay/Server transfers messages, provides operations of the MMS that are specific to or required by the mobile environment and provides (temporary and/or persistent) storage services to the MMS.

**MMS User Agent:** An application residing on a User Equipment, an Mobile Station or an external device that performs MMS-specific operations on a user's behalf. An MMS User Agent is not considered part of an MMSE.

**Originator MMS User Agent:** An MMS User Agent associated with the sender of an MM.

**Recipient MMS User Agent:** An MMS User Agent associated with the recipient of an MM.

### 3.2 Abbreviations

Abbreviations that apply to this specification are defined in [1], [2], and [4]. For readers' convenience, several are included below:

EM	Element Manager
MIME	Multipurpose Internet Mail Extensions
MM	Multimedia Message
MMS	Multimedia Messaging Service
MMSE	Multimedia Messaging Service Element (can also be Multimedia Messaging Service Environment in other technical specifications)
MMSO	Multimedia Messaging Service Originator
MMSR	Multimedia Messaging Service Recipient

---

## 4 Record Description

Two types of CDRs can be generated in the service domain for MMS by the MMS Relay/Servers. As described in TS32.200 [2], these types are: MMSO-CDR and MMSR-CDR. The content of each CDR type is defined in one of the two tables that are part of this section. For each CDR type the field definition includes the field name, description and category.

Equipment vendors shall be able to provide all of the fields listed in the CDR content table in order to claim compliance with this document. However, since CDR processing and transport consume network resources, operators may opt to eliminate some of the fields that are not essential for their operation. This operator provisionable reduction is specified by the field category.

A field category can have one of two primary values:

- M** This field is **Mandatory** and shall always be present in the CDR.
- C** This field shall be present in the CDR only when certain Conditions are met.. These Conditions are specified as part of the field definition. .

All other fields are designated as Operator (**O**) provisionable. Note that previously the letter “**O**” represented the word “Optional”. Using TMN management functions or specific tools provided by an equipment vendor, operators may choose if they wish to include or omit the field from the CDR. Once omitted, this field is not generated in a CDR. To avoid any potential ambiguity, a CDR generating element **MUST** be able to provide all these fields. Only an operator can choose whether or not these fields should be generated in their system.

Those fields that the operator wishes to be present are further divided into a mandatory and conditional categories:

- O<sub>M</sub>** This is a field that, if provisioned by the operator to be present, shall always be included in the CDRs. In other words, an **O<sub>M</sub>** parameter that is provisioned to be present is a mandatory parameter.
- O<sub>C</sub>** This is a field that, if provisioned by the operator to be present, shall be included in the CDRs when the required conditions are met. In other words, an **O<sub>C</sub>** parameter that is configured to be present is a conditional parameter.

The MMS Relay/Server shall be able to provide the CDRs at the Billing System interface in the format and encoding described in the present document. Additional CDR formats and contents, generated by the MMS Relay/Server, may be available at the interface to the billing system to meet the requirements of the billing system.

## 4.1 Service record for originating MMS (MMSO-CDR)

If enabled, an MMSO-CDR mobile originated MMS record shall be produced for each originating MM sent by a mobile user agent via the MMS Relay/Server.

**Table 1: Mobile originated MMS record (MMSO-CDR)**

Field	Category	Description
Record Type	M	Mobile Originated MMS.
MMS Relay Address	M	The IP address of the MMS Relay/Server of the originated MM.
Message ID	M	The MM identification provided by the MMS Relay/Server.
Reply Message ID	C	The reference MM identification provided by the MMS Relay/Server to correlate to the original MM in case of a Reply-Charging (See "Charge Information" parameter description.).
Originator address	M	The address of the originator MMS user agent of the original MM, i.e. the recipient of the read-reply report.
Recipient(s) address	M	The address(es) of the recipient(s) MMS user agent of the original MM, i.e. the originator of the read-reply report. Multiple addresses are possible. Note: a multiple group may be addressed.
Access Correlation	O <sub>M</sub>	A unique identifier delivered by the used access network domain of the originating MMS User Agent.
Content type	M	The content type of the MM content.
Message size	M	The size of the MM.
Message type	M	The category of the MM.
Forwarded Message Indicator	C	If present, this field shall indicate that the original MM was forwarded.
Message class	M	The class selection such as personal, advertisement, information service.
Charge Information	C	The charge indication and charge type.
Submission Time	M	The time at which the MM was submitted from the originator MMS user agent.
Time of Expiry	C	The desired date or duration of time prior to of expiry for the MM or reply-MM if specified by the originator MMS user agent.
Earliest Time Of Delivery	C	This field contains either the earliest time to deliver message or the number of seconds to wait before delivering the message.
Duration Of Transmission	O <sub>M</sub>	The time used for transmission of the MM between the user agent and the relay server..
Duration Of Storage	O <sub>M</sub>	The storage time of the MM in the MMS Relay/Server.
Delivery Type	O <sub>M</sub>	The status code of the delivered MM.
Delivery Result	C	The status of the delivered MM if requested.
Status Code	O <sub>M</sub>	This field includes a more detailed technical status of delivering the message
Sequence Number	C	Number of partial record if applicable
Record extensions	O <sub>C</sub>	A set of network / manufacturer specific extensions to the record.

## 4.2 Service record for recipient MMS (MMSR-CDR)

If enabled, an MMSR-CDR mobile recipient MMS record shall be produced for each terminating MM sent by a mobile user agent via the MMS Relay/Server.

**Table 2: Mobile recipient MMS record (MMSR-CDR)**

Field	Category	Description
Record Type	M	Mobile Recipient MMS.
MMS Relay Address	M	The IP address of the current MMS Relay/Server of the recipient MM.
Message ID	M	The MM identification delivered by the MMS Relay/Server.
Originator address	M	The address of the originator MMS user agent of the original MM, i.e. the recipient of the read-reply report.
Recipient address	M	The address of the recipient MMS user agent of the original MM, i.e. the originator of the read-reply report. Note: a multiple group may be addressed.
Access Correlation	O <sub>M</sub>	An unique identifier delivered by the used access network domain of the recipient MMS User Agent.
Content type	M	The content type of the MM content.
Message size	M	The size of the MM.
Message type	M	The category of the MM.
Message class	M	The class selection such as personal, advertisement, information service.
Charge Information	C	The charge indication and charge type.
Delivery Time	M	The time at which the MM was received by the recipient MMS user agent.
Time of Expiry	C	The desired duration of time prior to expiry for the reply-MM if specified by the originator MMS user agent.
Duration Of Transmission	O <sub>M</sub>	The time used for transmission of the MM between the user agent and the relay server.
Duration Of Storage	O <sub>M</sub>	The storage time of the MM in the MMS Relay/Server.
Delivery Ack Request	C	The indication for the delivery request
Sequence Number	C	Number of partial record if applicable
Record extensions	O <sub>C</sub>	A set of network / manufacturer specific extensions to the record.

---

## 5 Parameter Description

### 5.1 Access Correlation

A unique identifier delivered by the used access network domain of the originated/sending or recipient/receiving MMS User Agent. It may be used for correlation of the MMS CDRs with the corresponding MSC server CDRs in CS domain or GSN CDRs in PS domain.

### 5.2 Charge Information

This field consists of two parts, the charge indicator and the charge type. The charge indicator (charge/no charge) should be defined by the MMS Relay/Server.

The charge types are as follows:

- Reply – a definition.
- etc.

An originator of the MMS may take over the charge for the sending of a reply-MM to their submitted MM from the recipient(s). Therefore the originator MMS Relay/Server should mark the MM as no charge (reply-charged). The originator's MMSE could either accept the user's settings for charge type 'reply' or not. The originator of an MM may also indicate to take over the charge for the reply MM. In such case the charge type is 'reverse'.

### 5.3 Content Type

Multiple media elements shall be combined into a composite single MM using MIME multipart format as defined in RFC 2046 [6]. Content-type maps directly since both are defined as being MIME content types.

The content type of the message from the external server should be mapped to an appropriate MIME type/subtype and attached to the MM. (e.g. SMS via 3GPP TR 23.039[7] -> MM with text/plain).

The media type of a single MM element shall be identified by its appropriate MIME type whereas the media format shall be indicated by its appropriate MIME subtype.

To ensure interoperability with formats widely used (e.g. in the internet community) and to guarantee a minimum support and compatibility between multimedia messaging capable terminals the support of the following formats or codecs is suggested:

#### 1. Text types

Minimum supported set of:

- plain text. Any character encoding (charset) that contains a subset of the logical characters in Unicode [8] shall be used (e.g. US-ASCII [9], ISO-8859-1[10], UTF-8[11], Shift\_JIS, etc.).

Unrecognised subtypes of "text" shall be treated as subtype "plain" as long as the MIME implementation knows how to handle the charset.

#### 2. Image type

Minimum supported set of:

- Baseline JPEG [17].

Suggested format/codecs for media type Image:

- GIF 89a [18].

#### 3. Audio types

Minimum supported set of:

- AMR [12]; organised in the Bitstream Syntax as proposed by the IETF [13]

Suggested formats/codecs for media type Audio:

- MP3 [14]
- MIDI [15]
- AAC [16]

#### 4. Video types

Minimum supported set of:

- ITU T H.263 baseline [21]

Suggested formats/codecs :

- MPEG-4 Visual Simple Profile Level 0 [22] and [20]
- H.263 profile 3 level 10 [23]

To ensure interoperability for the transport of speech, audio and/or video media associated with an MM, the MP4 file format shall be supported. The usage of the MP4 file format shall follow the technical specifications and the implementation guidelines specified in 3GPP TS 26.234 [19]. (NOTE: This TS [19] specifies a mechanism for the registration of AMR and H.263 codestreams to be included in MP4 files.)

## 5. Application type

Any other unrecognised subtype and unrecognised character set, which aren't handled as "text/plain" shall be treated as "application/octet - stream".

## 5.4 DeliveryAckRequest/Delivery Result

This is the indication in the MMSR-CDR of the recipient MMS User Agent that a delivery report has been requested by the originator MMS User Agent. This field in the MMSO\_CDR contains the result of the MM delivery to the recipient.

## 5.5 Delivery Time

The delivery time field contains the time stamp relevant for the handling of the MM by the recipient MMS Relay/Server (read, deleted without being read, etc.). The time-stamp includes at a minimum: date, hour, minute and second.

## 5.6 Delivery Type

This field contains an appropriate status value to the delivered MM.

## 5.7 Duration of Transmission/Storage

These fields contain the relevant time in seconds. The Duration of Transmission is the time from the beginning to the end of the MM transfer between the MMS user agent and the MMS relay server; e.g. for streaming purposes. The Duration of storage is the time interval while the message is temporarily and/or persistently stored in the MMS Relay/Server.

## 5.8 Earliest Time of Delivery

This field contains either the earliest time to deliver message or the number of seconds to wait before delivering the message.

## 5.9 Forwarded Message Indicator

This field shall indicate that the original MM was forwarded. If this field is missing the message shall be treated as a regular message.

## 5.10 Message ID/Reply Message ID

The MMS Relay/Server shall provide an identification for a message, which it routed forward or has accepted for delivery. The MM Message-ID is mapped to a corresponding STD 11 [5] "Message-ID" header. Each MM message must have a globally unique messageID, which is carried in the "Message-ID" header. If a Forwarded Message Indicator is present the Message ID from the original MM must be preserved.

## 5.11 Message Class

A class of message such as personal, advertisement, information service etc. For more information see TS 23.140[4].

## 5.12 Message Size

The message size includes the number of octets during the MM transmission.

## 5.13 Message Type

A type that consists of one of the following four choices: Notification, Message MM, Delivery Report, Read-Reply.

## 5.14 MMS Relay Address

This field contains the IP address of the MMS Relay/Server, which has generated the CDR.

## 5.15 Originator Address/Recipient Address

These fields contains the originator/recipient or forwarding/forwarded MMS user agent address. The MMS supports the use of E-Mail addresses (RFC 822) [5], MSISDN (E.164) or IP address.

## 5.16 Record Extension

The field enables network operators and/ or manufacturers to add their own extensions to the standard record definitions.

## 5.17 Record Type

The field identifies the type of the record , e.g. MMSO-CDR and MMSR-CDR.

## 5.18 Sequence number

This field contains a running sequence number employed to link the partial records generated for a particular MM transfer over the air interface only.

## 5.19 Status Code

This field includes a more detailed technical status for delivery of the message and may contain one of the following causes:

- cause for termination, refer TS 32.205[25]
- cause for record closing, refer TS 32.215[26].

The status code is also extended by MMS specific information.

## 5.20 Submission Time

The submission time field contains the time stamps relevant for the submission of the MM. The time-stamp includes a minimum of date, hour, minute and second.

## 5.21 Time of Expiry

This field contains the desired date or the number of seconds to expiry of the MM, if specified by the originator MMS User Agent. In case of reply-charging, the time of expiry is the latest time of submission of a reply-MM.

## 6 Charging Data Record Structure

### 6.1 ASN.1 definitions for CDR information

The ASN.1 definitions are based on the charging specific data types within the current 3GPP 32-series, the TS 32.205 for CS domain[25] and TS 32.215 for PS domain[26].

## 7 Charging Data Record Transfer

The generated MMS-CDR in the MMS Relay/Server shall be transferred to the Billing System by the use of FTAM protocol on X.25 or TCP/IP, or FTP or TFTP over TCP/IP. For further details of the use of FTAM see GSM 12.01 [27] and of the use of FTP see [28] and TFTP see [29].

---
