3GPP TSG SA3-SA2 Joint Meeting Madrid, Spain 26th April, 2001

4.6 Roles of Session Control Functions

The CSCF may take on various roles as used in the IP multimedia subsystem. The following sections describe these various roles.

4.6.1 Proxy-CSCF

The Proxy-CSCF (P-CSCF) is the first contact point within the IM CN subsystem. Its address is discovered by UEs following PDP context activation, using the mechanism described in section "Procedures related to Local CSCF Discovery". The P-CSCF behaves like a Proxy (as defined in RFC2543 or subsequent versions), i.e. it accepts requests and services them internally or forwards them on, possibly after translation. The P-CSCF may also behave as a User Agent (as defined in the RFC2543 or subsequent versions), i.e. in abnormal conditions it may terminate and independently generate SIP transactions.

The Policy Control Function (PCF) is a logical entity of the P-CSCF. If the PCF is implemented in a separate physical node, the interface between the PCF and the P-CSCF is not standardised.

The functions performed by the P-CSCF are:

- Forward the SIP register request received from the UE to an I-CSCF determined using the home domain name, as provided by the UE.
- Forward SIP messages received from the UE to the SIP server (e.g. S-CSCF) whose name the P-CSCF has received as a result of the registration procedure.
- As part of processing of the request and before forwarding, the P-CSCF may modify the Request URI of outgoing requests according to a set of provisioned rules defined by the network operator (e.g. Number analysis and potential modification such as translation from local to international format.)
- Forward the SIP request or response to the UE.
- Detect an emergency session and select a S-CSCF in the visited network to handle emergency sessions.
- The gGeneration of CDRs.
- Maintain a Security Association between itself and each UE, as defined in Access Security for IP-based services Specification TS 33.203 xx-[19].
- Provide security towards Maintain Security Associations with Interrogating-CSCFs and Provide security towards Interrogating-CSCF and Serving-CSCF by s. The Security Associations are received or negotiated by the by security methods defined in Network Domain Security specification TS 33.2xx00 [20].

Verify integrity of incoming messages and decrypt incoming ciphered messages based on the Security Association.

Apply security protections based on the Security Associations to the outgoing messages.

Editor's Note: The following functions require further study:

 Authorisation of bearer resources and QoS management. Details of the P-CSCF role in QoS management and authorisation of bearer resources for the session are being investigated by the QoS ad-hoc group.

4.6.2 Interrogating-CSCF

Interrogating-CSCF (I-CSCF) is the contact point within an operator's network for all connections destined to a subscriber of that network operator, or a roaming subscriber currently located within that network operator's service area. There may be multiple I-CSCFs within an operator's network. The functions performed by the I-CSCF are: Registration

- Assigning a S-CSCF to a user performing SIP registration (see section on Procedures related to Serving-CSCF assignment)

Session Flows

- Route a SIP request received from another network towards the S-CSCF.
- Obtain from HSS the Address of the S-CSCF.
- Forward the SIP request or response to the S-CSCF determined by the step above

Maintain Security Associations with Proxy-CSCFs and Serving-CSCFs. The Security Associations are received or negotiated by the methods defined in Network Domain Security specification TS 33.200 [20].

- Provide security towards Proxy-CSCF by security methods defined in Network Domain Security specification TS 33.2xx [20].
- Provide security towards Serving-CSCF, if needed, by security methods defined in Network Domain Security specification TS 33.2xx [20].

Verify integrity of incoming messages and decrypt incoming ciphered messages based on the Security Association.

Apply security protections based on the Security Associations to the outgoing messages.

Charging and resource utilisation:

- Generation of CDRs.

In performing the above functions the operator may use the I-CSCF or other techniques to hide the configuration, capacity, and topology of the network from the outside. When the I-CSCF is chosen to meet the hiding requirement then for sessions traversing across different operators domains, the I-CSCF may forward the SIP request or response to another I-CSCF allowing the operators to maintain configuration independence.

4.6.3 Serving-CSCF

The Serving-CSCF (S-CSCF) performs the session control services for the UE. It maintains a session state as needed by the network operator for support of the services.

Within an operator's network, different S-CSCFs may have different functionalities. The functions performed by the S-CSCF during a session are:

Registration

- May behave as a Registrar as defined in RFC2543 or subsequent versions, i.e. it accepts registration requests and makes its information available through the location server (eg. HSS).

Session flows

- Session control for the registered endpoint's sessions.
- May behave as a Proxy Server as defined in RFC2543 or subsequent versions, i.e. it accepts requests and services them internally or forwards them on, possibly after translation.
- May behave as a User Agent as defined in RFC2543 or subsequent versions, i.e. it may terminate and independently generate SIP transactions.
- Interaction with Services Platforms for the support of Services
- Provide endpoints with service event related information (e.g. notification of tones/announcement together with location of additional media resources, billing notification)
- <u>Maintain Security Associations with Interrogating-CSCFs, BGCFs, Security towards and Proxy-CSCFs.</u>, <u>The Security Associations are received or negotiated by the methods as defined by in the Network Domain Security specification TS 33.200 [20].</u>
- Provide security towards Interrogating-CSCF and BGCFs, if needed, by security methods defined in Network Domain Security specification TS 33.2xx [20].
- Provide security towards Proxy-CSCF by security methods defined in Network Domain Security specification TS 33.2xx [20].

Verify integrity of incoming messages and decrypt incoming ciphered messages based on the Security Association.

Apply security protections based on the Security Associations to the outgoing messages.

- Based on operator policy, maintain Security Associations with another SIP server located within an ISP domain outside of the IM CN subsystem.
- When interacting with external Networks, Security associations should be provided in accordance with operator policy.

<u>Verify integrity of incoming messages and decrypt incoming ciphered messages based on the Security Association.</u>

Apply security protections based on the Security Associations to the outgoing messages.

- On behalf of an originating endpoint (i.e. the originating subscriber/UE)
 - Obtain from a database the Address of the I-CSCF for the network operator serving the
 destination subscriber from the destination name of the terminating subscriber (e.g. dialled phone
 number or SIP URL), when the destination subscriber is a customer of a different network
 operator, and forward the SIP request or response to that I-CSCF.

- When the destination name of the terminating subscriber (e.g. dialled phone number or SIP URL), and the destination subscriber is a customer of the same network operator, forward the SIP request or response to an I-CSCF within the operator's network.
- Depending on operator policy, forward the SIP request or response to another SIP server located within an ISP domain outside of the IM CN subsystem.
- On behalf of a destination endpoint (i.e. the terminating subscriber/UE)
 - Forward the SIP request or response to a P-CSCF for a MT session to a home subscriber within the home network, or for a subscriber roaming within a visited network where the home network operator has chosen not to have an I-CSCF in the path
- Forward the SIP request or response to an I-CSCF for a MT session for a roaming subscriber within a visited network where the home network operator has chosen to have an I-CSCF in the path.

Charging and resource utilisation:

- Generation of CDRs.

4.6.4 Breakout Gateway Control Function

The Breakout Gateway control function (BGCF) selects the network in which PSTN breakout is to occur. If the BGCF determines that the breakout is to occur in the same network in which the BGCF is located within, then the BGCF shall select a MGCF which will be responsible for the interworking with the PSTN. If the break out is in another network, the BGCF will forward this session signalling to another BGCF, or an MGCF, depending on the configuration, in the selected network.

The functions performed by the BGCF are:

- Receives request from S-CSCF to select appropriate PSTN break out point for the session
- Select the network in which the interworking with the PSTN is to occur. If the interworking is in another network, then the BGCF will forward the SIP signalling to the BGCF of that network.
- Select the MGCF in the network in which the interworking with PSTN is to occur and forward the SIP signalling to that MGCF. This may not apply if the interworking is a different network.
 - Maintain Security Associations with Serving-CSCFs and MGCFs. The Security Associations are
 received or negotiated by the methods defined in the Network Domain Security specification TS
 33.200 [20].
 - Provide security towards another BGCF by security methods defined in Network Domain Security specification TS 33.2xx [20].
 - Provide security towards Serving-CSCF and MGCFs, as needed, by security methods defined in Network Domain Security specification TS 33.2xx [20].

<u>Verify integrity of incoming messages and decrypt incoming ciphered messages based on the Security Association.</u>

Apply security protections based on the Security Associations to the outgoing messages.

Charging and resource utilisation:

- Generation of CDRs.

The BGCF may make use of information received from other protocols, or may make use of administrative information, when making the choice of which network the interworking shall occur.
